## PREFACE

THE purpose of this book is to point out, describe, and picture all of the points of interest reached by way of the regular highways, side roads and trails in Yellowstone National Park, and to give the scientific information necessary to a clearer understanding of the unusual phenomena.

To the individual motorist, who is unfamiliar with the park, it will prove of inestimable value in directing his attention to the interesting things, which otherwise he might unknowingly pass. The complete Road Log for convenience is quite condensed, and should be used by every motorist.

All travelers who have made the trip with this book will have a diary of the Yellowstone, which as time goes on will serve to recall to their minds not only the facts about the park, but also the interesting incidents of their visit.

To both Mr. Horace M. Albright and Mr. Chester A. Lindsley of the National Park Service, for their most valuable help in the preparation of this edition, the author is greatly indebted.

## OUT WHERE THE WEST BEGINS

Out where the handclasp's a little stronger,  
Out where the smile dwells a little longer,  
    That's where the West begins;  
Out where the sun is a little brighter,  
Where the snows that fall are a trifle whiter,  
And the bonds of home are a wee bit tighter,  
    That's where the West begins.

Out where the skies are a little bluer,  
Out where friendship's a little truer,  
    That's where the West begins;  
Out where a fresher breeze is blowing,  
Where there's laughter in every streamlet flowing,  
Where there's more of reaping and less of sowing,  
    That's where the West begins.

Out where the world is in the making,  
Where fewer hearts grow weary with aching,  
    That's where the West begins;  
Where there's more of singing and less of sighing,  
Where there's more of giving and less of vying,  
And a man makes friends without half trying—  
    That's where the West begins.

—ARTHUR CHAPMAN, The Rocky Mountain Club, N. Y. City

PARK PANORAMA—DRAWN BY THE AUTHOR

## YELLOWSTONE NATIONAL PARK

The Yellowstone Park, created March first, 1872, by act of Congress, was one of the first national parks in the United States, reserved from settlement, so that the natural wonders contained therein would be preserved for all time from mutilation of any kind.

The only evidences of civilization are the splendid highways, the system of trails reaching out into the less accessible places, hotels, camps and a few other buildings, made necessary in caring for the wants of travelers.

It has been stated that 100 feet from any road or trail, one finds a wilderness in the same virgin state in which the explorers of the famous expedition of 1870 found it.

The boundaries of the park embrace an area of more than 3,000 square miles, in which are the great terraces, which eclipse those in New Zealand, more and greater geysers than are found in Iceland, and all the rest of the world combined, and canyons whose volcanic sides, by decomposition of their minerals, have taken on the most brilliant and beautifully blended colors.

The park plateau averaging more than 8,000 feet elevation, on all sides is surrounded by mountains, waterfalls and cascades. In the heart of this plateau is Yellowstone Lake, 20 or more miles in length, which at its elevation, has but one rival in size, Lake Titicaca, in the Peruvian Andes.

In this area, in their native state, are found great numbers of wild animals, which free from molestation, have become comparatively fearless. Among the larger animals are the grizzly and black bears, the buffalo or American bison, moose and American elk. The National Park Service officials estimate that here there are between 20,000 and 30,000 elk. In the high mountain places are found the big horn mountain sheep, while lower down in the valleys in certain seasons, one may see the deer and antelopes.

19006

MR. HORACE M. ALBRIGHT, SUPERINTENDENT  
APPOINTED JUNE 28, 1919

Fishing in the lakes and streams is permitted under certain regulations, but no hunting of any kind is permitted. In the lakes, mackinaw trout have been caught weighing nearly 20 pounds, while in the rivers and streams are the eastern brook, rainbow, and other smaller varieties of trout.

The administration of the park is vested in the National Park Service, Department of the Interior, and the superintendent's office is at Mammoth Hot Springs. Throughout the park, however, are many ranger stations, some of them almost inaccessible, but situated at strategic points, for protecting this vast property, and for keeping animal-hunting poachers away.

Mr. Horace M. Albright, formerly Assistant Director of the National Park Service, took office as Superintendent of the park June 28, 1919. Mr. Chester A. Lindsley, who has long been identified with the administration of the Yellowstone, is Assistant Superintendent.

The government regulations are most reasonable, and are made simply for the protection of the park and its visitors.

At Mammoth Hot Springs, Upper Geyser Basin, Yellowstone Lake and the Grand Canyon are the four large hotels, operated by the Yellowstone Park Hotel Company.

The Yellowstone Park Camps Company operates permanent camps at Mammoth Hot Springs, Upper Geyser Basin, Yellowstone Lake, Grand Canyon and Tower Fall. All of the hotels and camps have the daily service of the automobile transportation line; and at these various places one may obtain saddle horses and guides for making the local side trips from each point.

SUPERINTENDENT'S OFFICE, MAMMOTH HOT SPRINGS

19005

Every usual requirement of the traveler is supplied at the hotels, camps, stores or picture shops in the park, all of which are operated by private companies under government leases and under supervision of the National Park Service.

A system of automobiles of the Yellowstone Park Transportation Company operates from all entrances to all points in the park. The independent motorist and the motorcycle rider are permitted on all roads of the park under certain regulations upon payment of a comparatively small entrance fee to the government. Some travelers go through the park with camp wagons, others on horseback in pack train outfits, while hikers, though few in number, are also enthusiastic about their trips. One may tour the park with one's own vehicle and camp outfit, and camp at any of the hundreds of places, and stay any length of time.

The Northern Pacific Railway reaches the Northern boundary at Gardiner, Montana; the Union Pacific System, the Western boundary at West Yellowstone, Montana; the Burlington Route goes to Cody, Wyoming, 55.4 miles east of the Eastern boundary, from which three points the park proper is easily accessible by splendid automobile highways. From the south, skirting Jackson Lake, the park is reached by highways from Lander, Riverton, Rock Springs and Jackson, Wyoming, and from Ashton, Idaho. The bulk of the travel, however, comes in at the Northern, Western and Eastern entrances.

Between Yellowstone, Glacier, Rocky Mountain and Mesa Verde National Parks, and throughout the West, automobile routes are being improved to meet the phenomenal increase in automobile travel.

The Yellowstone Trail Association and other strong organizations are rendering invaluable aid in bettering routes to these parks, and in supplying reliable data for automobile tourists.

All roads from the four park entrances, including Cody and Moran, Wyoming, the main loop road, and all side roads are tabulated in the Complete Road Log herein. These should be carefully followed so that one may not unknowingly pass important places of interest. The detail maps show hotels, camps, ranger stations, natural objects of interest, paths and roads, public automobile shelters and camps, stores and picture shops.

### IMPORTANT DON'TS

DON'T leave your camp fires burning.

DON'T throw away pipe ashes, cigar or cigarette stumps without completely extinguishing the sparks.

DON'T build fires in tree mould or near logs or brush.

DON'T build larger fires than necessary.

DON'T leave your camp uncleaned.

DON'T deface anything in the park with your name or initials.

DON'T cut any green timber.

DON'T collect specimens of any kind.

DON'T feed the bears.

DON'T run by STOP signs.

DON'T disregard the Red Flag SLOW-UP marker.

DON'T fail to keep to the RIGHT on all turns.

DON'T park your car on a turn.

DON'T speed.

The Rangers are well informed on the park, and on park customs, and if called upon for information can render valuable assistance to the traveler.

The above DON'TS are intended to lighten the burden of the Rangers in keeping the park, and traffic through the park in harmony.

## AUTOMOBILE AND MOTORCYCLE REGULATIONS

Pursuant to authority conferred by section 2475, Revised Statutes, United States, and the act of Congress approved May 7, 1894 (28 Stat., 73) as amended by the act approved June 28, 1916 (39 Stat., 238), the following regulations governing the admission of automobiles and motorcycles into the Yellowstone National Park are hereby established and made public.

**1. Entrances.**—Automobiles and motorcycles may enter and leave the park between 6 a. m. and 9:30 p. m. by any of the entrances, viz.: northern or Gardiner entrance, western or West Yellowstone entrance, eastern or Cody entrance, southern or Snake River entrance. The superintendent may in his discretion keep any or all of the gateways open longer each day should the public convenience make this appear necessary.

**2. Automobiles.**—The park is open to automobiles operated for pleasure but not to those carrying passengers who are paying, either directly or indirectly, for the use of machines (excepting, however, automobiles used by transportation lines operating under Government franchise.)

Careful driving is demanded of all persons using the roads.

The Government is in no way responsible for any kind of accident.

**3. Motorcycles.**—Motorcycles are admitted to the park under the same conditions as automobiles and are subject to the same regulations, as far as they are applicable.

**4. Permits.**—The permit shall be secured at the ranger station where the automobile enters, and will entitle the permittee to go over any or all of the roads in the park. It is good for the entire season, expiring on December 31 of the year of issue. The permit shall be conveniently kept so that it can be exhibited to park rangers on demand. Each permit must be exhibited to the checking ranger for verification on exit from the park.

**5. Fees.**—Fees for automobile and motorcycle permits are \$7.50 and \$2.50 respectively, and are payable in cash only.

**6. Direction.**—Automobiles shall pass around the road system forming the "loop" in the direction opposite to that of the hands of a

clock as indicated by the arrow printed in red on the automobile guide map.

THE REVERSE DIRECTION may be taken as follows:

Norris Junction (NJ) to Mammoth Hot Springs (MS) between 11 AM and 1 PM, and after 4:30 PM.

Madison Junction (MJ) to Norris Junction (NJ) any time of day or night except the periods 10 AM to 1 PM, and 3 PM to 6 PM.

Upper Geyser Basin, Old Faithful (OF) to Western Entrance (WE) any time after 1 PM.

Canyon Junction (CJ) to Lake Junction (LJ) any time day or night.

Mammoth Hot Springs (MS) to Tower Fall, early enough to reach Tower Fall by 1 PM.

Canyon Junction (CJ) to Norris Junction (NJ) direct, any time day or night.

The Superintendent of the park has authority to change routing of cars if necessary.

**7. Distance Apart, Gears and Brakes.**—Automobiles while in motion shall not be less than 50 yards apart, except for purpose of passing, which is permissible only on comparative levels or on slight grades. All automobiles except while shifting gears, shall retain their gears constantly enmeshed. The driver of each automobile will be required to satisfy the ranger issuing the permit that all parts of his machine, particularly the brakes and tires, are in first-class working order and capable of making the trip, and that there is sufficient gasoline in the tank to reach the next place where it may be obtained. The automobile shall carry at least one extra tire.

**8. Speeds.**—Speed is limited to 12 miles per hour ascending and 10 miles per hour descending steep grades, and to 8 miles per hour when approaching sharp curves. On good roads with straight stretches, and when no team is nearer than 200 yards, the speed may be increased to 25 miles per hour. Automobile trucks of more than 1½ tons capacity are limited to a speed of not to exceed 15 miles per hour on all park roads.

**9. Horns.**—The horn shall be sounded on approaching curves or stretches of road concealed for any considerable distance by slopes, overhanging trees, or other obstacles, and before meeting or passing other machines, riding or driving animals, or pedestrians.

**10. Lights.**—All automobiles shall be equipped with head and tail lights, the headlights to be of sufficient brilliancy to ensure safety in driving at night, and all lights must be kept lighted after sunset when automobile is on the roads. Headlights shall be dimmed when meeting other automobiles or horse-drawn vehicles.

**11. Muffler Cut-outs.**—Muffler cut-outs shall be closed while approaching or passing riding horses, horse-drawn vehicles, hotels, or camps.

**12. Teams.**—When teams, saddle horses, or pack trains approach, automobiles shall take the outer edge of the roadway regardless of the direction in which they may be going, taking care that sufficient room is left on the inside for the passage of vehicles and animals. Teams have the right of way, and automobiles shall be backed or otherwise handled as may be necessary, so as to enable teams to pass with safety. In no case shall automobiles pass animals on the road at a speed greater than 8 miles per hour.

**13. Overtaking Vehicles.**—Any vehicle traveling slowly upon any of the park roads shall, when overtaken by a faster moving motor vehicle, and upon suitable signal from such overtaking vehicle, give way to the right, in case of motor driven vehicles; and to the inside, or bank side of the road, in case of horse-drawn vehicles, allowing the overtaking vehicle reasonably free passage, provided the overtaking vehicle does not exceed the speed limits specified for the park highways.

**14. Accidents, Stop-overs.**—Automobiles stopping over at points inside the park, or delayed by breakdown or accidents of any other nature, shall be immediately parked off the road, or, where this is impossible, on the outer edge of the road.

**15. Fines and Penalties.**—Violation of any of the foregoing regulations will be punishable by revocation of automobile permit, or by immediate ejectment from the park, or by a fine not to exceed \$500, or six months' imprisonment, or by any combination of these penalties, and be cause for refusal to issue a new automobile permit to the offender without prior sanction in writing from the Director of the National Park Service.

**16. Garages, Repairs, Supplies, Free Automobile Camps.**—Gasoline, oils, tires, and accessories are available for purchase at regular supply stations at Mammoth Hot Springs, Upper Geyser

Basin (Old Faithful), Yellowstone Lake, and Grand Canyon. Repair shops and garages are maintained at these points. Automobile supplies may also be procured at Camp Roosevelt. Prices of supplies and rates for repair work are strictly regulated by the National Park Service. Free public camps for motorists are maintained at points indicated on the automobile guide map.

**17. Reduced Engine Power—Gasoline, Etc.**—Due to the high altitude of the park roads, averaging nearly 7,000 feet, the power of all automobiles is much reduced, so that a leaner mixture and about 50 per cent more gasoline is required than at lower altitudes. Likewise one lower gear will generally have to be used on grades than would be necessary elsewhere. A further effect that must be watched is the heating of the engine on long grades, which may become serious unless care is used.

Motorcycles equipped with single speed engines will encounter serious difficulties in negotiating the heavy mountain grades, and drivers are warned against making the attempt with this class of machine.

**18.** These regulations do not apply to motor traffic on the county road in the northwest corner of the park.

STEPHEN T. MATHER,  
Director, National Park Service.

Approved; to become effective March 1, 1920.

ALEXANDER T. VOGELSANG,  
First Assistant Secretary.

This park was established for the benefit and enjoyment of the people, and to safeguard natural conditions within its boundaries in unimpaired form for present and future generations. All visitors should read carefully the GENERAL RULES AND REGULATIONS IN THE CIRCULAR OF INFORMATION. Observe particularly that injury or impairment of any of the scenic features of the park or natural curiosities, such as geysers, hot springs, and beautiful formations, failure to extinguish camp fires, or the carving and writing of names on trees, platforms, formations, etc., constitutes violations of these rules and regulations, the penalties for which are the same as those prescribed for violations of the automobile regulations printed in full herein.

## TOUR OF THE PARK FROM THE NORTHERN ENTRANCE

**Gardiner Station**, Northern Pacific Railway, and Gardiner are just outside of the park at the northern boundary. The Yellowstone Park Transportation Co. operates a line of automobile stages to all points in, and all entrances of the park.

**Arch at Northern Entrance** bearing the inscription, "Yellowstone National Park, Created by Act of Congress, March 1, 1872, for the Benefit and Enjoyment of the People," was built in 1903 by the government and was dedicated by President Roosevelt.

**Gardiner Canyon.**—On the drive to Mammoth Hot Springs an ascent of 875 feet is made in five miles. The elevation at Gardiner is 5,400 feet; at Mammoth, 6,275 feet.

**Mt. Everts**, at left, was named for T. C. Everts, who became separated from the exploring party in 1870 and on foot wandered about the park region thirty-seven

NORTHERN ENTRANCE ARCH. GARDINER, MONTANA

ADMINISTRATIVE HEADQUARTERS

10301

days without food or firearms before being rescued. (See "Discovery of Yellowstone Park, 1870," by N. P. Langford.)

**Mammoth Hotel**, operated by the Yellowstone Park Hotel Co., is situated with the Yellowstone Park Headquarters at the foot of the hot spring terraces. Road follows south past terraces up slight incline to—

**Mammoth Camp**, operated by the Yellowstone Park Camps Co., and situated at the foot of Jupiter Terrace in sight of Bunsen Peak.

**Fort Yellowstone**, abandoned by the army, is the administrative headquarters of the park. The **Superintendent's Office**, where free circulars of information and other data relating to Yellowstone and other national parks may be obtained, is situated here.

**Hymen Terrace**, one of the most beautifully colored spots in the park, is on the main plateau at the right of Liberty Cap. A veil of steam softens and blends its vivid colorings, while innumerable water-glazed knobs reflect the sunlight like a thousand mirrors. This terrace

MAMMOTH HOTEL AND AUTOMOBILE STAGES

17225

is growing fast and it is gravely feared that the openings may become choked by the abundance of depositing lime. Should this happen it would be a matter of but a few days before the coloring would be gone, leaving the bare travertine rock exposed to the destructive forces of the elements.

**Liberty Cap**, an extinct hot spring cone, standing at the foot of Terrace Mountain, near the road, is 38 feet high and twenty feet in diameter at its base. It is formed of over-lapping layers of deposit, evidently having been built by an overflow of water through the orifice in the top.

**Cleopatra Terrace**, a short distance above Hymen Terrace, is a good example of the growing deposit. When the overflow from any of these hot springs changes its course, the algae, which produce the color, disappear from the abandoned runway, and soon the new course is brilliantly colored.

**Minerva Terrace** is colored one season and appar-

MAMMOTH CAMP AND JUPITER TERRACE

17331

ently dead another, so it is difficult to predict in advance of the season whether its spring will flow or not; usually, however, it is active.

**Mound Terrace** during 1918 became more active than usual, the northern face being beautifully colored over a considerable area, and the flow of water was greater than for several seasons past.

**Pulpit Terrace** is a mass of stalactites grown almost together. This part of Jupiter Terrace has been given a separate name and the story goes that a famous clergyman once actually delivered a sermon from this natural pulpit.

**Jupiter Terrace**, the greatest of them all, has been built up by the overflow from two very large hot pools which discharge their mineral-laden water over a large part of this great mound.

**Cupid's Cave** is west of the pools on Jupiter Terrace. When active this brilliant terrace formation in

JUPITER SPRING

19023

JUPITER TERRACE, TRAVERTINE FORMATION

10230

an ashen setting of the ruins of former terrace life, presents a most striking and pleasing contrast. A few years ago the overflow re-entered the ground through an opening large enough for one to enter. There were stalactites above and stalagmites below, which gradually grew together and finally filled the opening. Lately there has been a noticeable diminution in the activity of all springs near this cave; and Canary spring has become quite dry.

**Narrow Gauge Terrace** during recent years has become less active. About ten years ago hot water flowed from many openings along this fissure, almost completely covering both sides. Now activity is confined to the western end.

**Lookout Point.**—The view from here is up the valley of the East Gardiner River through which the road from the Grand Canyon and Tower Fall to Mammoth Hot Springs has been built.

**Orange Spring Formation.**—This isolated mound has been built up by a small spring in its top to a height

ORANGE SPRING FORMATION

BUFFALO HERD NEAR MAMMOTH

10136

of 15 feet. From here the road leads a short distance east, up grade, to a ridge overlooking—

**Bath Lake.**—The luke warm water supplied from a spring on the southern shore of this lake is very fine for bathing. The government has built a small bath-house on its northern shore. While there is no visible outlet to this lake, the water is always fresh, as it constantly flows away through fissures below the surface. Bathers should be very cautious, as the bed of Bath Lake is rough and the rock very sharp in places.

**Devil's Kitchen** may be safely entered by the stairway. This cave is the interior of an extinct hot spring as the character of the walls plainly show. It was first explored in 1881, at which time numerous bones of wild animals were found.

**White Elephant.**—The hot springs along the summit of this ridge are now practically extinct, but the great volume of the deposit indicates that these springs were active probably for centuries; until the mound was built so high that there was not sufficient water pressure for the springs to flow.

ANGEL TERRACE

19016

**Stalactitic Cave** and Stygian Cave, above which is an old formation called St. Jacob's Ladder, are about 600 feet west of the White Elephant. Stygian Cave exhales the poisonous carbonic acid gas which has claimed the lives of many birds and small animals.

**Angel Terrace** is passed on the way from the White Elephant to the main road. This terrace is probably the most beautiful of all in point of coloring.

**The Buffalo Herd.**—The buffaloes or American bison of the park may be classed in three groups, namely: The "show" herd near Mammoth Hot Springs, which is fenced in, the "tame" herd on the Lamar river, 29 miles east of Mammoth Hot Springs, and the scattering wild bands which have not become connected with the herds directly under the government's care.

**Geological.**—The Yellowstone Park is geologically young, but so old that the slow erosive power of running

GEOLOGICAL PROFILE OF MAMMOTH HOT SPRINGS

10155

water has carved furrows a thousand feet or more into its solid rock.

The mountains are igneous; and all through the Park are evidences of violent volcanic eruptions as shown by extensive lava beds. Amygdaloid cliffs and great gnarled masses are common; there are obsidian cliffs, great geometrical blocks, petrifications and geodes, besides the print of leaves in rock where forests have fallen prey to the flowing hot mud.

Some sedimentary deposits are also found here near the northern boundary, in the form of limestone beds, clays and shales. There were glacial invasions from the north, too, which have left hills of sand and gravel, and isolated boulders at various points.

The most wonderful deposit in the region is this **Formation at Mammoth Hot Springs**, which is composed of pure calcium carbonate, dissolved from the limestone beds below and brought to the surface by the hot springs. It is many acres in extent—of unknown depth—and is the result of periods of successive deposition and

decay extending over a great length of time. The deposit is building where overflowed by water and crumbling to a chalky powder where dry.

The water is heated by great masses of rock which have not yet cooled below the zone of percolating water. Such conditions are also seen today in New Zealand and Iceland.

Four factors are held responsible for the practically complete precipitation of the lime carried by the water to the surface; namely, (1) the "eating" process of the algous growth which thrives in the hot water, (2) the giving off of carbonic acid to the air, (3) the cooling of the water and (4) evaporation.

The chief attraction of this great deposit is its beautiful coloring; harmonizing shades of yellow and brown with occasional streaks of dark green and red characterize the formation where the hotter water flows. The predominating rust color is found in the tepid water further from the mouths of the hot springs. The abandoned portions of the deposit are a glaring chalk-white, the colorings being present only on the active terraces. It is the algae that color these terraces more beautifully than could natural mineral coloring or the hand of man; the algous growth—a low form of plant life—cleaves closely to the rock in a velvet-like covering and requires hot or tepid water in which to live.

Nor are the pool colorings due to minerals; the United States Geological Survey states authoritatively that these colors are due to the reflection and refraction of the light rays, influenced by the nature and color of the pool linings and their surroundings.

---

**Silver Gate and Hoodoos.**—The driveway from Mammoth to Golden Gate ascends the mountain by such easy grades that one does not realize that a thousand feet elevation is gained in less than three miles.

It passes through the limestone Hoodoos, a wild region heretofore inaccessible. Many theories are ad-

SILVER GATE, LIMESTONE HOODOOS

18080

vanced as to the origin of the "Hoodoos." The most plausible is that the immense quantity of deposit or formation seen lower down the valley, even as far as Gardiner River, two miles distant, was carried there in solution by the hot waters of Mammoth Springs, thus leaving honeycombed caves beneath; the present Hoodoo region was formed by the surfaces caving in, filling the cavern below with huge masses of fractured rock. This condition is seen over an area of about a square mile. In the midst of the "Hoodoos" the road makes an abrupt turn, passing between great blocks of limestone to which is applied the very appropriate name, "**Silver Gate.**"

**Golden Gate**, one of the most picturesque drives in the Park, is a rugged pass between the base of the lofty elevations of Bunsen Peak and the southern extremity of Terrace Mountain. The sides of these rocky walls rise 200 to 300 feet above the roadway and are covered with a yellow moss, suggesting its name.

GOLDEN GATE CANYON AND VIADUCT

10079

**Rustic Fall**, at the west end of Golden Gate Canyon, adds a charm to this beautiful spot; in the early part of the season the fall is especially fine. The stream, Glen Creek, is fed by mountain snows and springs, along the base of the hills, a mile or so away; at the fall it leaps some sixty feet over a series of shallow basins worn into the dark, moss-covered ledge and disappears underneath an accumulation of rock in the canyon.

**Swan Lake Basin.**—A pleasant surprise awaits the visitor immediately beyond Golden Gate where the road comes suddenly into a broad mountain prairie hemmed in by snow-clad peaks. The magnificent Gallatin range rising abruptly from the foothills, composed of Bell Peak, Quadrant Mountain, and Mount Holmes (alt. 10,578 feet), are conspicuous in the foreground. About eight miles to the north is **Electric Peak** (alt. 11,155 feet), the highest mountain in the

ELECTRIC PEAK, 11,155 FEET

10081

**Park**, which, containing a large amount of magnetic ore, attracts lightning during storms.

**Apollinaris Spring** is on the east side of the road near the ten-mile post—a delicious spring of natural Apollinaris water, as refreshing as the genuine article of commerce.

**Obsidian Cliff**, a bold escarpment of volcanic glass, is twelve miles south of Mammoth Hot Springs. The vertical columns of pentagonal-shaped blocks of obsidian, rising some 250 feet above the road, present a glistening, mirror-like effect when illumined by the sun. The greater part of this mineral glass is jet black and quite opaque, with streaks of red and yellow. The construction of the roadway was accomplished in a novel manner; great fires were built around the blocks of glass, which, when heated, were suddenly cooled by dashing water upon them, thus shattering them into small fragments. This is probably the only piece of glass road in the world. Obsidian Cliff was “neutral ground” to all the Rocky Mountain Indians, and undoubtedly as sacred to the various hostile tribes as the the far-famed Pipestone country of Minnesota. Chips of obsidian and speci-

mens of partly finished arrow heads of obsidian are found throughout the Park, generally at places occupied by the Indians as summer camps.

About  $4\frac{1}{2}$  miles from Norris, **Roaring Mountain** is seen steaming from countless openings in its furrowed sides. Its ashen color and the muffled sound of escaping steam, less audible now than in the past, make this sight one to be long remembered. Near the roadside at the base of the mountain are greenish, milky pools fed by rivulets of sulphur water from the springs.

**Twin Lakes**, about four miles from Norris, are remarkable for their beautiful colors. Although situated adjacent to each other they are of decidedly different hues.

The next object of interest is the **Frying Pan**, a basin fifteen feet across, completely filled with little hot springs, or steam vents, which are constantly in a state of violent agitation.

The **Norris Ranger Station** is situated on the far bank of the Gibbon river a short distance north of **Norris Junction (NJ)**.

**Norris Geyser Basin** was formerly called "Gibbon Geyser Basin," but on account of the extensive work of exploration done by Colonel P. W. Norris while he was Superintendent of the Park (1877 to 1882), its name was changed to Norris Geyser Basin.

Geysers at NORRIS BASIN	Max. Height	Duration	Intervals of Eruption
Constant.....	35 ft.	5-15 sec.	20-55 sec.
Echinus.....	30 ft.	3 min.	45 min.
Minute Man.....	15 ft.	15-30 sec.	1 to 3 min.
Monarch.....	125 ft.	6 min.	Irregular.
New Crater.....	20 ft.	1-4 min.	2-5 min.
Whirligig.....	15 ft.	10 sec.	Irregular.

CONSTANT GEYSER. NORRIS GEYSER BASIN

10083

**Congress Pool.**—The first sight that attracts the visitor is this immense boiling spring close to the road on the left as one enters the basin. For many years it was only an opening in the rocks from which a great quantity of steam was constantly escaping; the roaring of which could be heard for miles. During the winter of 1893 the "Steam Vent" ceased and the Congress Pool formed.

To the left of the board walk are **Opal Springs**, the **Iris Pool**, and the **Grindstone**, all hot, boiling pools.

The **Constant Geyser** has a basin twenty-four feet across, out of which displays take place with marked regularity every thirty seconds; a very pretty geyser. A few feet to the south is a similar basin, the crater of the **Whirligig**, which plays quite like the Constant, but not so frequently.

The **Mud Geyser** is passed on the way to the Valentine and Black Growler. Some seasons this geyser erupts with great violence, displays frequently occurring about sixty feet high.

NATIONAL PARK SERVICE MOTORCYCLE RANGER

19080

**Black Growler Steam Vent** attracts much attention; it roars constantly and emits great volumes of steam. The deposit around the crater is quite black in places. The vent a few yards north of the Black Growler is known as the **Hurricane**; it is quite similar but not so violent as the former.

Situated east of the roadway is the **Bath Tub**. It has a well-formed basin, and while it does not erupt, it is in constant agitation.

**Emerald Pool** is seen next; a large, quiescent lake of boiling hot water with a greenish tinge, situated south of the Bath Tub.

**New Crater Geyser**.—This geyser is about 500 feet southeast of Emerald Pool, surrounded by huge blocks of dark yellow rock. It came into prominence during the fall of 1891, when quite a commotion, not unlike an earthquake, was observed. When it burst forth a great volume of water was forced out, flooding the

NATIONAL PARK SERVICE HORSEBACK RANGER

19079

ravine leading to the valley below. Since then it has settled down to ordinary eruptions, about every three minutes. The rock-covered crater prevents the discharge from attaining any great height.

**Monarch Geyser** is situated at the base of the hill, nearly surrounded by a bluff of brilliantly colored rocks, upon the level of the plateau about 1,000 feet east of the roadway. The crater consists of two oblong openings, the larger of which is twenty feet long and three feet wide. Eruptions of the Monarch occur without warning and consist of a series of explosions in which columns of water are thrown 100 feet high. The intervals of eruptions are about six hours.

**Fearless Geyser**, situated 500 feet south of the Minute Man Geyser, throws jets of water in every

direction during eruptions. Norris is the newest geyser basin in the Park and probably the one most rapidly changing. One cannot be sure a season in advance whether any one of its geysers will be doubly active the coming summer or become entirely inactive.

The **Minute Man Geyser** is interesting on account of its regularity, and the fact that most of the water thrown out flows back into the crater after the eruption. Its crater is small and appears to have been originally only a fissure in the rock.

Three miles from Norris Basin the road enters **Elk Park**, a beautiful valley surrounded by heavily-timbered hills.

**Chocolate Spring**, an unique hot spring has built a cone of rich chocolate color across the river from the road.

At the northern entrance to Gibbon Canyon on the opposite side of the river from the road is Mount Schurz, on the summit of which is the **Monument Geyser** Basin, a thousand feet above. Unless one is inclined to scientific observation, a climb up the steep trail to this basin is hardly justified. A dozen or so crumbling geyser cones, some steaming and rumbling, others apparently extinct, constitute its total attractiveness.

**Gibbon Canyon.**—The roadway enters Gibbon Canyon on the east side of the river, which it follows, as nearly as practicable, for three or four miles, shadowed by precipitous cliffs in places a thousand feet high.

**Beryl Spring** is attractive and deserves particular notice, being the largest boiling spring in the Gibbon canyon and the hottest one in the park. It is fifteen feet across, and is close by the roadside about a mile from the entrance to the canyon.

**Gibbon Falls**, whose waters tumble in a foamy torrent down a steep cascade on one side and on the other, flow in a thin, shining ribbon of silvery spray from a height of over eighty feet is next seen.

## TOUR OF THE PARK FROM THE WESTERN ENTRANCE

**West Yellowstone Station**, Union Pacific System, and West Yellowstone, Montana, are just outside of the park at the western boundary. The Yellowstone Park Transportation Co. operates a line of automobile stages to all points within the Park and to and from all entrances in connection with the Yellowstone Park Hotels and Camps.

**Christmas Tree Park** is about three miles wide where the road crosses it. The government engineers constructed an ideal roadway here which has a bed of crushed rock and an oiled surface for several miles.

The Rainbow and Loch Leven Trout of the Madison River have made this section of the park famous. It is not uncommon for an expert angler to land a six-pound rainbow trout in this vicinity, a sport to be fully appreciated only by experience. The United States Bureau of

WEST YELLOWSTONE STATION, UNION PACIFIC SYSTEM

Fisheries' work in the Yellowstone reserve is to be commended, many ideal trout streams having been destitute of fish life before being stocked.

**Mt. Burley** rises from the water's edge several hundred feet high on the south side of the Madison Canyon, a rugged escarpment of lava rock.

**National Park Mountain** is at the confluence of the Gibbon and Firehole rivers. At this point in 1870 the famous Washburn expedition, while in camp, resolved to direct their efforts toward having the present Yellowstone Park set aside as a National Park (See "Discovery of Yellowstone Park, 1870," by N. P. Langford.)

**Cascades of the Firehole.**—Here a short halt is usually made so these beautiful cascades may be viewed from different points. Below the upper cascades the river is confined in a narrow gorge until it reaches the main falls. The Firehole River owes a large part of its flow to the immense drainage from the geyser basins, and in many places the water is warm; in spite of this fact, however, trout abound in its pools all the way from Madison Lake, its source, to these cascades.

The **Fountain Ranger Station**,  $3\frac{1}{2}$  miles beyond the Firehole Cascades, is at the junction of the main road and the cut-off road from Excelsior Geyser.

**Nez Perce Creek**, made famous by the Nez Perce Indians headed by Chief Joseph on their memorable raid through the park in 1877, is crossed near Lower Basin.

**Lower Geyser Basin** is a comparatively wide valley, embracing an area of thirty or forty square miles. In this valley Dr. Hayden, in his official survey of the park region, has catalogued 693 hot springs. The chief attractions here are the Fountain and Great Fountain Geysers, the Mammoth Paint Pots, Clepsydra Geyser and Firehole Lake.

**Fountain Geyser**, about 2,000 feet south of the old hotel, occupies a mound, built up by its own deposit over an area of several acres.

This geyser has proven very unreliable the past few seasons. When both the pool and crater are full of water

to the rim, it is probable that an eruption will soon take place. Immediately before action the water falls from twelve to eighteen inches below the crater rim, from which point it spouts gradually until the climax is reached.

In July, 1899, the Fountain Geyser ceased operations and remained inactive until October, when it resumed its usual displays. In the meantime an immense geyser broke out in the large pool north of the Fountain. Its eruptions were of great force, quite irregular, but equal to those of Old Faithful, and continuing, at times, fully an hour.

In July, 1909, it abandoned its crater for the one adjoining and threw out jagged masses of geyserite more than 200 feet. The water was muddy and full of rock fragments for many hours; and as late as September, large pieces of rock were thrown out during the more violent eruptions.

For two days preceding the breaking out of this geyser in its new place, much disturbance was noted; loud rumblings were heard and the thumping of the entombed steam and water, gaining in violence each hour, alarmed even those most used to the strange phenomena of the geyser region. During the remainder of the season of 1909 the Fountain Geyser played much higher than before, like a stream through a smaller nozzle, but its eruptions were less regular.

Geysers at LOWER BASIN	Max. Height	Dura- tion	Intervals of Erup- tion
Fountain.....	75 ft.	10 min.	Irregular
Great Fountain....	150 ft.	45-60 min.	8 to 12 hours
AT MIDWAY BASIN			
Excelsior.....	300 ft.	Variable	1 to 4 hrs. Ceased to play in 1888.

**Clepsydra Geyser** some fifty feet west from the Fountain, has developed into an active geyser of no small eruptive power.

**Mammoth Paint Pots.**—This remarkable mud caldron has a basin 40x60 feet in size with a mud rim which is from four to five feet high. In this basin is a mass of fine, whitish mud which is in a state of constant agitation. It resembles a boiling pot of paint with numerous points of ebullition. There is a continuous bubbling up of mud, which, rising in hemispherical masses, cones, rings and jets, produces sounds like a whispered "plop-plop."

**Great Fountain Geyser** is about two miles south of the hotel and one mile east of the main road. The description by David E. Folsom, who witnessed a display October 1, 1869, faithfully portrays its present exhibitions:

"The hole through which the water was discharged was ten feet in diameter, and was situated in the center of a large circular shallow basin into which the water fell. There was a stiff breeze blowing at the time, and by going to the windward side and care-

MAMMOTH PAINT POTS

EXCELSIOR GEYSER. 300 FEET. CEASED TO PLAY IN 1888.

10094

fully picking our way over convenient stones we were enabled to reach the edge of the hole. At that moment the escaping steam was causing the water to boil up in a fountain five or six feet high. It stopped in an instant, and commenced settling down—twenty, thirty, forty feet—until we concluded that the bottom had fallen out, but the next instant, without any warning, it came rushing up and shot into the air at least eighty feet, causing us to stampede. It continued to spout at intervals of a few moments for some time, but finally subsided.”

Many interesting and curious sights in the vicinity of the Great Fountain should be visited. The “White Dome,” “Surprise,” **Firehole Lake**, “Mushroom,” and **Buffalo Spring** are the most prominent. The last was discovered in 1869 by an early exploring party. In describing their trip the writer says:

“In one of these springs we saw the whitened skeleton of a mountain buffalo that had probably fallen in accidentally. No king was ever more magnificently entombed than this monarch of the hills in his sepulchre in the wilderness.”

**Midway Geyser Basin** is the upper portion of the Lower Basin, and is about midway between the Upper and Lower Geyser Basins.

**Excelsior Geyser.**—"Early explorers in this locality discovered, in 1871," says Dr. Peale "on the west bank of Firehole River, an immense pit of rather irregular outline, 330 feet in length by 200 feet in width at the widest part. The water is of a deep blue tint, and is intensely agitated all the time, dense clouds of steam constantly ascending from it. It is only when the breeze wafts this aside that the surface of the water, which is fifteen or twenty feet below the level surrounding, can be seen. The walls on three sides are perpendicular, cliff-like, and in places overhang, having been worn away on the other."

Visited by thousands annually, this section became known as "Hell's Half Acre," a name it retained until 1881, when discovered by Colonel P. W. Norris to be a geyser of great force, and then named by him, "Excelsior." Its eruptions in 1881 began after the tourist season had closed; Colonel Norris witnessed thirty eruptions, varying from 75 to 250 feet in height, at intervals of one to four hours. The intervals of eruptions during 1888 were at first about every hour and fifteen minutes, increasing towards the latter part of the season to two hours. Immediately preceding each eruption a violent upheaval occurred, raising the entire volume of water in the crater nearly fifty feet, then instantly one or two, and sometimes three, terrific explosions would occur, followed closely by the shooting upwards of columns of water, and oftentimes masses of the rocky formation, to a height of 200 to 250 feet. Tons of rock have in this way been hurled into the Firehole River.

**Turquoise Spring**, about 150 feet north of Excelsior, is a silent pool, about 100 feet in diameter, and remarkable for its beautiful blue transparent water. When Excelsior was in action the water in this spring sank fully ten feet and did not resume its normal condition for nearly a year.

**Prismatic Lake** is the largest and one of the most beautiful springs in the Park region. Over its central

pit or bowl, the water is of a deep blue color, blending to green towards the edge, while in the shallower portions it has a yellow tint gradually blending into orange at its edge. The water flowing off in every direction, with constant wave-like pulsations over the scalloped and slightly raised rim of the lake, has formed a succession of terraces, each a few inches in height, down the slopes of the mound. It is impossible to exaggerate the delicacy and richness of the coloring. The temperature of the water is about 146 degrees Fahrenheit.

**Biscuit Basin** is on the west side of Firehole River about a mile below Riverside Bridge. In Biscuit Basin is **Sapphire Pool**, whose highly ornamented margin suggested its odd name. Hundreds of small biscuit-like knobs surround the spring. A few feet to the west is

**Jewel Geyser**, whose eruptions occur with the remarkable frequency of from three to five minutes, throwing jets of water to a height of about forty feet. West 500 feet are the **Black Pearl** and **Silver Globe**. The former has a beautiful basin, studded thickly with black pearls, each about a quarter of an inch in size. A curious feature of this little spouter is the fact that its formation surrounds the roots and stump of a tree, completely incrusting it with its black ornamentations.

The Silver Globe derives its name from the constant rising to its surface of large, silvery bubbles of gas, which, of course, immediately disappear on reaching the air.

**Artemisia Geyser** is sixty feet in diameter and generally very little agitated, merely overflowing. The surrounding formation, quite unlike that of any other geyser is as hard as flint, and of an olive-green color. Although for the most part very quiescent, this spring has occasional pulsations in the nature of eruptions, at which times large quantities of water are forced out, flooding the formation. These eruptions occur at intervals of twelve to twenty-four hours.

**Morning Glory Spring** is passed just before coming to the Riverside Bridge. The symmetrical shape and

MORNING GLORY SPRING, CLOSE-UP

13070

funnel-like crater whose walls are delicately colored, account for its appropriate name. At the surface the diameter is 23 feet and the temperature 100 degrees F., and apparent depth 29 feet.

**Upper Geyser Basin** contains twenty-six geysers and upwards of 400 hot springs. The Firehole River drains it, centrally; its shelving banks are thickly pitted with steaming hot springs and studded with mounds and cones of geyserite. Here, grouped within the narrow space of perhaps a square mile are the grandest and mightiest geysers known to man; and silent pools of scalding, meteoric water that for beauty of formation and delicacy of coloring are marvels. The surface of the basin consists, for the most part, of a succession of gentle undulations, each crowned with a geyser-cone or hot-spring vent and covered with layers of silicious sinter that give it a grayish-white, sepulchral hue. Clouds of vapor hang shroud-like above it; the earth trembles and is filled with strange rumblings, the air is heavy with sulphurous fumes, and vegetable life is extinct. In a paper read be-

fore the Cardiff (Wales) Naturalists' Society, Mr. Charles T. Whitmell said:

"Nowhere else, I believe, can be seen, on so grand a scale, such clear evidence of dying volcanic action. We seem to witness the death throes of some great American Enceladus. Could Dante have seen this region, he might have added another terror to his Inferno."

The **Riverside Geyser**, which is on the east bank of the Firehole River a few feet above the new steel bridge, erupts every six or seven hours, obliquely across the river; sometimes eruptions take place as frequently as each five and one-half hours for a period of several days.

The Riverside formation is made up of two craters on a chimney-like mound of silicious deposit; the lower, or main crater, overflows continuously for about an hour before each eruption; jets of water are thrown out about twenty minutes before displays, from the upper crater. The maximum height of the Riverside is one hundred feet; this is maintained for eight minutes, followed by the characteristic steam-period lasting several minutes.

RIVERSIDE GEYSER, 100 FEET 16065

The next feature of prominence is the **Grotto Geyser** which has the most extraordinary formation of any geyser in the park; it received this appropriate name in 1870 from the Washburn party. Eruptions vary in interval from two to eight hours, and are about thirty feet high, lasting from fifteen minutes to eight hours. Occasionally the Grotto ceases and the **Rocket**, an isolated cone a few feet north, plays to a height of fifty feet for two

Geysers at UPPER GEYSER BASIN	Maximum Height	Duration	Intervals

Turban.....	40 ft.	10 min.-3 hrs.	With Grand and frequently.

or three minutes; then the Grotto resumes. The pool near the road north of the Rocket is called the **Spa** (a mineral spring); it has not been observed to erupt, but empties and fills at intervals indicating a probable relation to some distant geyser.

The **Giant Geyser**, about five hundred feet south-east of the Grotto, is the **highest geyser in the world**; it plays two hundred and fifty feet, for a period of one and one-half hours, every six to fourteen days. Its maximum height, however, is maintained only during the

GROTTO GEYSER FORMATION

14029

first twenty minutes. The Giant Geyser cone is ten feet high and has one side partly broken off, exposing its channel, which is four feet across.

On the same deposit are three boiling cauldrons—the **Catfish**, **Bijou** and **Mastiff**, all of minor importance. Near these is a sign marked “Indicator,” but it is very uncertain if activity of the Giant is ever foretold by activity of these smaller basins. In some cases, however, geysers do have true indicators, notably the Beehive.

The **Daisy Geyser**, located near the **White Pyramid**, is a very pretty and reliable geyser. The character of its eruptions which occur every 70 to 80 minutes, are very like the **Splendid Geyser** which ceased to play about the time the Daisy broke out in 1892. The Daisy plays seventy-five feet high; duration, three minutes. Across the road from the Daisy is **Bonita Pool**, which acts as its indicator. The **Brilliant** is a beautiful, blue, quiescent, hot spring. Near it is the **Comet**, which boils

HANDKERCHIEF POOL

14009

up at intervals, and has built up a small cone of geyserite.

**Punch Bowl Spring.**—The road leading westward from the Splendid toward Black Sand and Sunset Basins passes the Punch Bowl, by far the handsomest spring of its class in the geyser region. Situated on the summit of a mound some five feet above the general level, it is about ten feet in diameter, with a glittering rim of colored formation eighteen inches in height. A small, cave-like opening on the east side of the mound appears to be lined with satin of the rarest beauty and texture. Early visitors to the Park during the seasons of 1873 and 1875 speak of this spring as being an active geyser, and during 1888 similar reports gained currency. Nothing, however, is definitely known as to the correctness of these reports.

**Black Sand Spring** and Specimen Lake.—Dr. Peale's description of Black Sand Spring is interestingly comprehensive, and is as follows:

"This is one of the most beautiful springs in the Upper Basin. It has a delicate rim, with toadstool-like masses around it. The basin

CHARLEY MOORE'S TRAIL RIDERS AT OLD FAITHFUL

12436

slopes rather gently toward a central aperture that, to the eye, appears to have no bottom. The water in the spring has a delicate turquoise tint, and as the breeze sweeps across its surface, dispelling the steam, the effect of the ripple of the water is very beautiful. The sloping sides are covered with a light brown crust; sometimes it is rather a cream color. The funnel is about forty feet in diameter, while the entire space covered by the spring is about 55x60 feet, outside the rim of which is a border of pitch-stone (obsidian) sand or gravel sloping twenty-five feet. From its west side flows a considerable stream, forming a most beautiful channel, in which the coloring presents a remarkable variety of shades; the extremely delicate pinks are mingled with equally delicate tints of saffron and yellow, and here and there shades of green."

The overflow from this spring spreads out over a large area, called **Specimen Lake**, which deserves more than passing notice. Absorption of silica has destroyed many trees in the vicinity, the dry, lifeless trunks still standing.

**Sunset Lake**, reached by a footbridge over Iron Creek, is a beautifully colored pool which steams constantly. It is larger than **Rainbow Pool** and situated a few steps north of it. Several yards north at the edge of the timber is the most beautiful pool in the Upper Basin—**Emerald Pool**; its deep emerald color blends to yellow toward the edge, and the formation is a rich red immediately around it. This pool, though hot, never boils, and is slightly overflowing. Across the river from Emerald Pool is **Green Spring**.

**Handkerchief Pool** is but a few feet from Rainbow Pool, a small basin with a funnel-shaped opening. A handkerchief placed in the water near the edge will be drawn downward and out of sight by convection currents in the water, and in a few minutes will reappear.

**Cliff Spring** usually is boiling violently; and though credited by some with having occasional eruptions, it is usually considered to be only a spring. It is close to the foot-bridge on the west side of the river.

**Whistle Geyser**, near the road leading toward Old Faithful Inn, performs only at great intervals; but when the great rush of steam commences, as it does several times each season, a whistle-like roar is produced which is audible half a mile and lasts several minutes.

The **Three Sisters** springs, while attractive, are so like a hundred other boiling pools that they are usually passed without a halt. They are situated in sight of Old Faithful Inn and not far from the Castle Geyser (on the road leading direct from the Riverside Geyser to the hotel.)

TOURISTS AND GEYSER HILL, OLD FAITHFUL

CASTLE GEYSER IN STEAM PERIOD, 75 FEET

11742

The **Castle Geyser** is at once recognized by its large cone resembling "an old feudal castle partially in ruins" (Doane). The great amount of deposit, perhaps 100 feet in diameter at its base, indicates that it is the oldest geyser in the Park. The orifice of the geyser tube in the top of the cone is about three feet in diameter, quite round, and is lined with a bright orange color. Eruptions occur at intervals of about twenty-six hours. Several times each season it has eruptions of an unusual character, in which its columns of water are thrown to twice their usual height. A violently boiling spring situated near the base of its cone, which used to be a favorite spot for "campers-out" in earlier days, is ten feet across, has an apparent depth of 52 feet and a temperature of 199 degrees F.

**Castle Well** is a large, crested spring 100 feet north

HAMILTON CURIO STORE, OLD FAITHFUL

16159

of the Castle. This spring is twenty feet in diameter and overflows on two sides.

The **Hamilton Curio Store**, formerly the Klammer Curio Store, has a large variety of supplies and interesting souvenirs, and oil and gasoline.

OLD FAITHFUL GEYSER BATHS

10202

OLD FAITHFUL INN AND AUTOMOBILE STAGES

19025

The **Upper Basin Ranger Station** is situated on the bank of the Firehole river in front of the Old Faithful Inn, about a quarter of a mile distant.

**Old Faithful Inn** (alt. 7,394 feet), the most extensive log structure yet devised by man, with every convenience and luxury of the modern hotel, is the latest triumph in utilizing primitive material in construction. The rough blocks of stone of its foundation appear as natural as when found at the base of the cliffs of the mountains.

The center of the building, rising eight stories high, is surmounted by the lookout, affording a splendid view of the geyser basin. From half a dozen golden-topped flag-staffs float the emblems of various nations. At night, by a powerful searchlight, one sees geysers in action, and bears feeding at the edge of the timber. The illumination

of Old Faithful Geyser in action is a sight never to be forgotten. The Old Faithful Inn was first opened to the public for the season of 1904.

**Old Faithful Geyser.**—Every seventy minutes (with rarely a variation of five minutes) day and night, summer and winter, this wonderful manifestation of nature gives its exhibition. This geyser is one of the most popular in the Park, because of the remarkable regularity with which its eruptions occur, and the excellent opportunities afforded for observation. Eruptions by moonlight, at sunrise or sunset, in a storm or with clear weather with their varied effects equally command the attention of the visitor.

Its eruptions begin with a few spasmodic spurts, during which considerable water is thrown out; these

OLD FAITHFUL INN BED ROOM

OLD FAITHFUL GEYSER AT SUNRISE, 120-170 FEET

10160

HAYNES PICTURE SHOP, OLD FAITHFUL

15083

are followed by a column of hot water two feet in diameter which is projected upward 125 to 150 feet, which height is maintained for about three minutes.

**Haynes Picture Shop**, operated by the official photographer of Yellowstone Park, has a complete line of photographs, prints, lantern slides, photographic supplies, post cards, cameras and films.

**Artificial Geyser.**—To demonstrate the theory of geyser action, the author built a miniature geyser model which produces eruptions three feet high, at intervals of one minute. This model is on exhibition at the Haynes Picture Shop in front of Old Faithful Inn. In 1915 he built the model for the Interior Department, in their laboratories in Washington, D. C.

**Old Faithful Camp** is well situated just beyond Old Faithful Geyser. In addition to guests patronizing the camps on their entire tour, the occasional guests, motorists, horsebackers and hikers may obtain meals and lodgings at any of these camps. The **Public Auto Shel-**

OLD FAITHFUL CAMP AND AUTOMOBILE STAGES

18322

OLD FAITHFUL CAMP. TWO-ROOM TENT

15069

**ter** is reached by turning off the main highway near Upper Basin Camp. This shelter and the many others in the park are provided by the National Park Service for the free use of motorists.

The **Beehive Geyser** is situated on **Geyser Hill** across the river. Its symmetrical cone, shaped like an old-fashioned beehive, is four feet high and three feet across. The Beehive plays out of its nozzle-like opening to the amazing height of two hundred feet.

Its eruptions are foretold by the spouting of its indicator, an inconspicuous fissure in the formation ten feet north of the cone.

There is undoubtedly a relation between this geyser and the Giantess, a hundred yards higher up on Geyser Hill, because invariably after eruptions of the Giantess, the Beehive plays two, three and sometimes four times, at intervals of eight to twelve hours; and occasionally, but rarely, once before the Giantess, but at no other times.

A few feet east of the Beehive cone at the top of the river bank, is the **Cascade Geyser**, now but a quiet spring. Down at the river's edge is the **Sputterer**, which discharges at intervals directly into the river. On the opposite bank is the **Chinaman Geyser**, which was named in memory of that Oriental who established a laundry here, put in the clothes and soap, and was annihilated, so the story goes, by the violent eruption which ensued. It is a remarkable fact that a bar or two of soap will cause practically any geyser to play within a few minutes. The practice of causing eruptions in this manner became so common a few years ago that the government put a stop to it, as it was feared the geysers would be injured.

The **Giantess Geyser** occupies the most prominent position on Geyser Hill. Its displays attain the height of one hundred feet, and are accompanied by shocks and tremors not unlike earthquakes. After the thirty-foot crater of the Giantess is emptied, a steam-period ensues, the entire eruption lasting from twelve to twenty-four

SPONGE GEYSER

16337

hours. During 1911 the intervals between eruptions varied from four to twelve days; while a few years ago the Giantess played only every three to four weeks. This accurate record disproves, in this case at least, that the geysers are all diminishing in eruptive violence and frequency. It is now pretty generally believed that, while this thermal activity as a whole is decreasing, a century brings only an imperceptible change. The late N. P. Langford, writer and explorer, who visited the Park with the Washburn party in 1870, stated in 1910, while at the Upper Basin, that he saw absolutely no perceptible change in Old Faithful Geyser, or any of the others.

The **Butterfly Spring**, several rods east of the Giantess, is interesting from the fact that both its shape and coloring resemble a butterfly; it is about four feet across and has openings in both "wings."

On the prominence with the Giantess, are two cauldrons, the **Teakettle** and the **Vault**; the latter is a geyser which plays eight feet high twenty-four hours

before the Giantess. **Topaz Pool** is at the base of the Giantess mound.

The **Pump**, at the foot of the Giantess mound in the direction of Sponge Geyser, is a hole eighteen inches across out of which comes a thumping sound resembling an hydraulic ram at work.

**Sponge Geyser**, a short distance east of the Giantess, is remarkable on account of the appearance of its cone, a flinty formation, porous and yellow like a sponge. The eruptions occur a minute and a quarter apart and are about four feet high.

**Doublet Pool**, marked "Dangerous" on the sign-board, is a good example of the overhanging crust formation. No doubt in time it will be practically all covered over; although this sinter formation, characteristic of the entire Upper Basin, forms very slowly.

**Beach Spring**, north of the Doublet, has a central opening surrounded by a rather wide, submerged beach, which is symmetrical and practically flat.

LION GEYSER, 60 FEET

The **Ear** is on the summit of a mound between the Beach and the Lion group. Curiously enough it not only resembles an ear in shape, but the lobe is pierced and the earring is a tiny geyser. It is here that messages are transmitted, so the story goes, to regions below.

The **Lion Geyser**, with the Lioness and two Cubs, occupies a conspicuous mound west of the Giantess and in sight of the hotel.

The **Lioness Geyser** has not been observed to play at all some seasons, while during other seasons eruptions have been noted at intervals of about fifteen days. In 1903 the Lion, Lioness and both Cubs played simultaneously one day for a large party of tourists. The larger Cub plays with the Lioness to a height of thirty feet; the smaller one plays frequently, but only a few feet high.

A path leads from the Lion group past the **Liberty Pool** to the **Sawmill Geyser**, which gets its name from the peculiar noise during eruptions; the maximum height of this geyser is forty feet, and interval three to four hours. Its indicator is a few feet southeast; both the indicator and the Sawmill start together, and very suddenly, throwing water in every direction.

The **Grand Geyser** is one of the finest in the park. It discharges forked columns of water to a height of two hundred feet in a series of eruptions eclipsing Old Faithful and occurring nearly every day.

Adjacent to the Grand Geyser crater is the **Turban Geyser**, which plays out of a small fissure next to the main crater of the Turban. When quiet, the larger crater often presents the appearance, in its interior, of a dancing flame, caused by the light playing on the bubbles of gas which constantly arise therefrom. Many of the early explorers really believed that internal fires were visible here. Firehole Lake, at the Lower Basin, also affords a good example of this phenomena. The Turban plays twenty-five feet high and at an angle, eruptions lasting an hour or more, and occurring with the Grand Geyser and at other times.

GEYSER EGGS NEAR SAWMILL GEYSER

14016

The fittingly-named **Economic Geyser** is a few rods north of the Turban; after its eruptions all the water flows back into the crater and disappears. The Economic plays only fifteen or twenty feet high, but in its general form resembles Old Faithful.

**Beauty Spring**, a large, silent pool is remarkable for its coloring and its highly ornamented margin. **Chromatic Pool**, nearby, is a good example of colored geyser formation; a rust color predominates in various shades from yellow to richest brown, blending into green and delicate pinks. The mushroom-like algaous growths seen in some of the bordering pools are of interest on account of their peculiar forms and colors, and to the scientist who knows what an important part the algae have in the rate and manner of deposition of silica.

The **Oblong Geyser** is on the opposite side of the Firehole River from Chromatic Pool. Its crater is remarkable in that no better example of interior geyser structure is seen in the entire park. Large globular masses of tan colored geyserite form the rim; the water

OBLONG GEYSER CRATER

10100

is a delicate blue color and of such transparency that the two fissures in the bottom of the crater are plainly seen. Preceding eruptions the crater fills to the shore line and boils for fifteen minutes.

**GEOLOGICAL.**—A geyser may be defined as a periodically erupting hot spring, as its water is not volcanic but simply hot meteoric water; so a geyser is not a volcano ejecting water but a true spring. Were the heat sufficient and the tube long enough all hot springs would erupt.

Sounds like cannonading are heard directly preceding a geyser eruption; this is caused by the collapse of steam bubbles from the hotter region below rising through the cooler strata of water. The surface of the pool, from which the geyser plays, bulges and overflows, and sometimes jets of water are thrown upward preceding activity.

GEOLOGICAL PROFILE, TYPICAL GEYSER

13029

The famous scientist, R. W. Bunsen, after making a careful study of geyser action by extensive observation and experiment, advanced the following authoritative explanation:

It is well known that the pressure in water (being due to gravity) increases with the depth; and furthermore, that the boiling point rises with the increase in pressure. The geyser tube which extends deep into the earth is filled with water from the higher tracts of land around; the heat is from the buried masses of lava not yet cool, lava being such a great non-conductor and retainer of heat.

The typical geyser eruption may be divided into five stages, namely, (1) the water remains practically stationary after the tube has filled, and becomes steadily hotter, (2) steam bubbles rising through the cooler strata of water, collapse, producing the characteristic premonitory "cannonading," (3) steam forms below

in sufficient quantity to cause the surface to overflow, thus the pressure is lessened in all parts of the tube, and (4) the great burst of steam ensuing, ejects all the water from the tube, (5) the steam follows and while the tube is filling for another eruption, there is no activity other than occasional puffs of steam.

**From the Upper Basin to Yellowstone Lake**  
the road leads up the Firehole River to

**Kepler Cascade**, less than two miles distant, whose waters form a series of enchanting falls, aggregating 100 to 150 feet in height.

**Lone Star Geyser**, off the main road, is visited only as a side trip. Its cone, twelve feet high, has a large central opening and numerous small ones from which water is thrown. The cone is its principal attraction, although the eruptions are at times 75 feet high.

At a point eight miles from Upper Basin is **Norris Pass** through which a trail leads south to Shoshone Lake. **Craig Pass** is one-half mile further.

ISA LAKE, CONTINENTAL DIVIDE

**Isa Lake** is next seen; its waters flow to both the Atlantic and Pacific Oceans from the summit of the Continental Divide. **Two Ocean Pond**, a similar lake, is also on the summit of this range a few miles south of Yellowstone Lake.

The **Continental Divide**, altitude 8,240 feet, is crossed twice between the Upper Basin and Yellowstone Lake. It enters the Yellowstone Park near the Western Entrance and passes through the reserve to its southern border forming the water-shed between Yellowstone Lake and the head waters of Snake River.

**Shoshone Point** affords a most commanding view. It overlooks the country to the south, Shoshone Lake in a beautiful valley, and the Teton Mountains many miles south.

Beyond Shoshone Point the road again crosses the continental divide at an altitude of 8,345 feet.

**Shoshone Lake** has an area of about 12 square miles, and a very irregular shore line. Shoshone Geyser Basin on the west shore of the Lake has several large geysers and numerous interesting springs. It is reached by trail from Lone Star Geyser.

On a clear day from Shoshone Point may be seen the snow-capped Teton Mountains, fifty miles distant, that form a portion of the boundary between the states of Wyoming and Idaho, their dizzy heights overtopping all other peaks of the region.

**Lake View.**—A mile from West Thumb bay one catches the first glimpse of Yellowstone Lake. From this point David E. Folsom, of the Folsom and Cook exploring party in 1869, says:

“As we were about departing on our homeward trip we ascended the summit of a neighboring hill and took a final look at Yellowstone Lake. Nestled among the forest-crowned hills which bounded our vision lay this inland sea, its crystal waves dancing and sparkling in the sunlight as if laughing with joy for their wild freedom. It is a scene of transcendent beauty which has been viewed by but few white men, and we felt glad to have looked upon it before its primeval

WEST THUMB BAY OF YELLOWSTONE LAKE

12766

solitude should be broken by the crowds of pleasure seekers which at no distant day will throng its shores."

The **Thumb Ranger Station** is situated facing the lake at **West Thumb Junction (WT)**, where the road from Moran, Wyoming, via the Southern Entrance, joins the main loop road.

At the **West Thumb** there are several geyser cones, paint pots and springs.

The **Lake Shore Geyser** plays at intervals several feet high. The **Fishing Cone**, named by the Expedition of 1870, has a boiling spring in its centre which projects above, and is surrounded by the cold water of the Lake. This is the famous place where fishermen stood and, after catching trout in the Lake, boiled them while still on the hook (a practice now prohibited by law.)

Four miles toward Moran the **Continental Divide** is crossed once more, and at 9.6 miles Lewis Lake is reached. There is a good camping ground at this point.

**Lewis Falls** may be viewed from the bridge over the Lewis River, 13.2 miles from West Thumb.

**Moose Fall** at 22.1 miles also is well worth seeing. It is reached by a footpath 100 yards down Crawfish Creek.

The **Southern Entrance (SE)** and the **Snake River Ranger Station** are 23.6 miles from the main loop road of the park, and 25.5 miles north of Jackson Lake at Moran, Wyoming.

**Mt. Moran**, one of the large peaks of the Teton range, was named for the great American painter, Thomas Moran, whose canvasses have so truly depicted the greater features of the West. In 1917 a party of climbers scaled this mountain as far as the big central glacier for the purpose of determining its extent. Emerson Hough, writer, Huntley Child of the Yellowstone Park Hotel Company, Robert C. Reamer, architect of the Old Faithful Inn and the Grand Canyon Hotel, I. L. Peil, Advertising Manager Northern Pacific Railway, Howard H. Hays, now owner of Yellowstone Park Camps Company, Charles d'Emery and the author reached the glacier.

It was their unanimous verdict that Jackson Lake in its towering mountain setting, would soon draw to its shores hundreds of recreationists not alone for the romantic interest that attaches to this former rendezvous of the bad men of the West, but for its grandeur, picturesqueness and the opportunities for mountain climbing, fishing and trail riding.

THE GRAND TETON, 13,691 FEET 10067

MT. MORAN FROM JENNY LAKE

19004

The **Government Dam** recently completed at Moran has raised the water level of Jackson Lake several feet, increasing the volume of water in this already large natural reservoir to such an extent that the flow of the Snake River is made suitable for vast irrigating projects along its course many miles away.

**The Grand Teton**, 13,691 feet, is the rugged peak lying to the southward across Jackson Lake.

From the Thumb the road leads northeast along the shore of Yellowstone Lake.

The **Natural Bridge** is passed 3.2 miles from the Lake Hotel. It spans a small creek and looks quite symmetrical from the lower side. Its abutments are thirty feet apart, and the arch sixty feet high.

The **Yellowstone Lake** is the largest at its elevation (7,741 ft.) in the world with the exception of Lake

LEWIS FALL, LEWIS RIVER

19013

Titicaca, Peru. It is twenty miles long and of very irregular outline. The snow-capped Absaroka Mountains rise to altitudes of ten or eleven thousand feet from the eastern shore.

Several islands dot the surface of this icy sheet of water, Stevenson and Frank Islands being the largest. The Yellowstone River is its principal affluent and sole outlet, its upper portion draining a considerable area tributary to the lake on the southeast. The vast body of water thus accumulated in this natural mountain reservoir furnishes a never-failing water volume for one of the grandest of the Missouri's tributaries.

The **Lake Hotel**, of Colonial architecture, is one of the system of four large hotels operated by the Yellowstone Park Hotel Company in the park.

LAKE HOTEL. YELLOWSTONE LAKE

LAKE HOTEL DINING ROOM

16025

LAKE CAMP SINGLE TENT

15071

TWIN CUB BEARS

10142

The **Lake Camp**, of the Yellowstone Park Camps Company, is one of the newest tent cities in the park. It is composed of a large central log building and many separate tents.

The **Lake Ranger Station** is situated near the Lake outlet and the public **Automobile Camp Grounds**.

In the mountain range on the east side of the lake can be seen the **Sleeping Giant**, formed of several peaks of the Absaroka Range.

## TOUR OF THE PARK FROM THE EASTERN ENTRANCE

**Cody, Wyo.**, founded by the late Col. Wm. F. Cody, "Buffalo Bill," is near the terminus of the Chicago, Burlington and Quincy Railroad branch. From Cody the automobile highway leads up the Shoshone River 55.2 miles to the eastern boundary of Yellowstone Park. To the main loop road in the Park at Lake Junction it is 82.2 miles.

**Burlington Cody Cafe**, at the railroad depot, is nearly a mile from Cody proper, on the opposite side of the Shoshone River. (To use the Motorists' Log of this interesting drive set mileage indicator at 0.5 at the Shoshone River Bridge. The complete Log appears in the front part of this book.)

At 6.9 miles the first tunnel of six on this road is met in winding through the precipitous Shoshone canyon.

**Shoshone Dam**, at 7.6 miles, 328 feet in height, is the second highest in the world. Its top is 200 feet long

SHOSHONE CANYON, SHOSHONE RIVER

SHOSHONE CANYON TUNNEL 17236

and ten feet thick, while its base is only 80 feet long and 108 feet thick. The immense reservoir created by the dam makes possible the irrigation of vast tracts of land along the course of Shoshone River.

At 29.2, seven-tenths of a mile past the **Overhanging Rock Cliff**, the irregular rock formations of the **Holy City** are seen at the right.

**Thor's Anvil** at 29.8 and the Thousand Foot Cliff at 30.6 are next passed.

At 42.6 the Elephant Head and the Mutilated Hand both formed in the eroded rock are seen toward the north.

ELEPHANT HEAD, SHOSHONE HIGHWAY

THE HOLY CITY, CLOSE-UP

17251

Chimney Rock at 43.2 by the roadside is the next prominent feature.

**Pahaska Tepee**, 52.9, Buffalo Bill's lodge, breathes the romance of that picturesque figure in Western history. It is near the junction of the North Fork of the Shoshone River and Middle Creek, 53 miles from Cody and about two miles east of the Park boundary.

**The Sylvan Pass Ranger Station** is at the **Eastern Boundary**, 55.2 miles from Cody and 27 miles from the main loop road in the Park on Middle Creek. The road climbs steadily to an elevation of 8,650 feet at

**Sylvan Pass**, at 62.9 miles. Lake Eleanor at 63.6, Sylvan Lake at 65.2 and Turbid Lake at 75.6 are next passed; before reaching the main loop road are the Osprey's Nest at 76.3 and the Fishing Bridge over the Yellowstone River at 82.0 miles.

PAHASKA TEEPEE LODGE

16408

SYLVAN LAKE

17296

From the **Lake Junction (LJ)**, at 82.2, the right (north) road leads to the Grand Canyon, and the left road to Yellowstone Lake.

From the lake to the Grand Canyon the road follows the Yellowstone River through Hayden Valley.

**Mud Volcano** is 6 miles from the Junction on the mountain side; its funnel-shaped crater 30 feet deep, partly filled with a lead-colored mass of mud in violent agitation, produces an effect at once repulsive and fascinating. In 1898 violent eruptions occurred, which plastered surrounding trees with mud.

**The Dragon's Mouth Spring**, a few rods north of Mud Volcano, is a beautiful, overflowing hot pool beneath a natural green colored rock gable. Its peacefulness pleasantly contrasts with the violence of the Mud Volcano.

The **Chittenden Bridge** across Yellowstone River is the longest Melan arch in the world. The road leads across this bridge to the Grand Canyon Camp and Artist Point, from which one may enjoy by far the best view of the Fall and Canyon.

CHITTENDEN BRIDGE, YELLOWSTONE RIVER

GRAND CANYON CAMP BUILDING

15040

**Grand Canyon Camp**, one of the largest tent cities in the park, is within walking distance of the Upper Fall, the trail to the foot of the Great Fall and to Artist Point. Horseback rides, fishing trips, and photographing jaunts are among the popular pastimes here. At the camp each night is a large outdoor camp fire whose crackling embers syncopate the music of the dance within.

The **Upper Fall** has a perpendicular drop of 109 feet, and the water, striking a shelving rock at the bottom of the abyss, shoots out rocket-like. Above the fall a jutting point affords an excellent view of the rapids and the foaming waters rushing over the precipice. A footpath leads to the bottom of the Upper Fall, where very fine brook trout fishing may be had.

The **Canyon Ranger Station** is conveniently situated by the road not far from the Public **Automobile Shelter**.

**Whittaker's Canyon Store**, where supplies and gasoline may be obtained, is next door to the Ranger Station.

UPPER FALL OF THE YELLOWSTONE, 109 FEET

14053

The **Grand Canyon Hotel** was first opened to the public June 15th, 1911, at a cost of over three-quarters of a million dollars. It accommodates six hundred guests.

Spending the day at this hotel is a pleasure. A cozy foyer, extensive lounge and capacious dining room are all elegantly furnished and of novel architecture. Adjoining the main building is the lounge, where concerts and dances are held. It is remarkable that so many miles from any railroad hotels can be so well equipped as to rival the best city hostelries.

**Brink of the Fall** reached by a 494 foot stairway on the hotel side (northern) of the canyon affords a splendid view of Point Lookout and Red Rock at the left, and Artist Point nearly two miles away on the right side of the gorge.

GRAND CANYON HOTEL

14056

**Grand View.**—There are many projections between Lookout and Inspiration Points from which glimpses of the canyon may be had. Grand View is about midway nearly opposite **Artist Point**.

**Inspiration Point** is considered the best place from which to see and appreciate the immensity of the canyon.

**Glacial Boulder**, passed on the drive to Inspiration Point, bespeaks the great transporting power of the glaciers.

Rev. Dr. Wayland Hoyt describes as follows his conception of what Thomas Moran has said to be the most brilliantly colored landscape in existence:

“Look yonder! That is the Lower Fall of the Yellowstone. It is not the grandest in the world, but there is none more beautiful. There is not the breadth and dash of Niagara, nor is there the enormous depth of leap of some of the waterfalls of the Yosemite. But here is majesty of its own kind, and beauty, too. On either side are vast pinnacles of sculptured rock. There, where the rock opens for the river, its waters are compressed from a width of 200 feet between the Upper and Lower Fall, to less than 100 feet when it takes the plunge. The shelf of rock over which it leaps is absolutely level. The water seems to wait a moment on its verge; then it passes, with a single bound, 308 feet into the gorge below. It is a sheer, unbroken compact, shining mass of silver foam. But your eyes are all the while distracted from the fall itself, great and beautiful as it is, to its marvelous setting; to the surprising, overmastering canyon into which

GRAND CANYON HOTEL LOUNGE

13073

the river leaps, and through which it flows, dwindling to but a foamy ribbon therein its appalling depths. As you cling there to this jutting rock, the fall is already many hundred feet below you. The fall unrolls its whiteness down amid the canyon glooms. \* \* \* \* \* These rocky sides are almost perpendicular; indeed, in many places the boiling springs have gouged them out so as to leave overhanging cliffs and tables at the top. Take a stone and throw it over; you have to wait long before you hear it strike. Nothing more awful have I ever seen than the yawning of that chasm. And the stillness, solemn as midnight, profound as death. The water dashing there, as in a kind of agony, against these you cannot hear. The mighty distance lays the finger of silence on its white lips. You are oppressed with a sense of danger. It is as though the vastness would soon force you from the rock to which you cling. The silence, the sheer depth, the gloom burden you. It is a relief to feel the firm earth beneath your feet again, as you carefully crawl back from your perching place.

“But this is not all, nor is the half yet told. As soon as you can stand it, go out on that jutting rock again and mark the sculpturing of God upon those vast and solemn walls. By dash of wind and wave, by forces of the frost, by file of snow plunge and glacier and mountain torrents, by the hot breath of boiling springs, those walls have been cut into the most various and surprising shapes. I have seen

GREAT FALL OF THE YELLOWSTONE, 308 FEET

16260

the 'middle age' castles along the Rhine; there those castles are reproduced exactly. I have seen the soaring summit of the great cathedral spires in the country beyond the sea; there they stand in prototype, only loftier and more sublime.

"And then, of course, and almost beyond all else, you are fascinated by the magnificence and utter opulence of color. Those are not simple gray and hoary depths, and reaches and domes and pinnacles of sullen rock. The whole gorge flames. It is as though rainbows had fallen out of the sky and hung themselves there like glorious banners. The underlying color is the clearest yellow; this flushes onward into orange. Down at the base the deepest mosses unroll their draperies of the most vivid green; browns, sweet and soft, do their blending; white rocks stand spectral; turrets of rock shoot up as crimson as though they were drenched through with blood. It is a wilderness of color. It is impossible that even the pencil of an artist can tell it.

"Through nearly all the hours of that afternoon until the sunset shadows came, and afterwards amid the moonbeams, I waited there, clinging to that rock, jutting out into that overpowering, gorgeous chasm. I was appalled and fascinated, afraid, and yet compelled to cling there. It was an epoch in my life."

GRAND CANYON FROM BRINK OF GREAT FALL

15049

**Mount Washburn**, altitude 10,388 feet, the famous park promontory, is the highest mountain in the park which may be climbed by auto. From the Grand Canyon Hotel to the summit of this mountain many thrills are experienced in driving for the first time up this steep incline of ten miles. The usual route, however, is not over the summit of the mountain, but through **Dunraven Pass**, altitude 8,900 feet, midway between Dunraven Peak and Mount Washburn.

**Haynes Tower Fall Picture Shop and Information Station** is the first stopping place. Cars may be parked here while the walk down a trail to Tower Fall is made. This site is desirable as a camping place for those who have with them their camping equipment. Fishing at the mouth of Tower Creek attracts those anglers whose

FROM THE SUMMIT OF MT. WASHBURN, 10,388 FEET

16276

pleasure is catching the larger and gamier specimens.

**Tower Fall** is 132 feet high; near it are the tall rock spires which gave this fall its name.

HIKERS AND PACK HORSE

12442

TOWER FALL, TOWER CREEK, 132 FEET

17384

GRAND CANYON NEAR TOWER FALL

14050

**Camp Roosevelt**, operated by the Yellowstone Park Camps Company, is three miles further on near **Tower Fall Junction (TJ)** and the **Tower Fall Ranger Station**.

The **Buffalo Farm**, maintained by the National Park Service, where the large "tame" herd of American Bison are, is 10.8 miles from Tower Fall Junction on the right side road.

The **Petrified Trees** are situated one-half mile south of the main roadway, 16.7 miles from Mammoth Hot Springs; they are two large standing stumps on the hillside.

It is 16.7 miles to Mammoth Hot Springs from the Petrified Trees, an interesting drive through the canyon of the East Gardiner River, then over the high steel bridge which spans the Middle Gardiner River, two miles east on Mammoth.

## ANIMALS OF YELLOWSTONE PARK

**A**LTHOUGH unfenced, Yellowstone Park is the largest and best game preserve in North America.

Being suited to the habits of such a large number of species of large and small animals, it preserves them in their natural state free from the molestation of the hunter. With exception of the Mountain Lion and Coyote, both of which are very harmful to the young of the other large game, especially the young Mountain Sheep, Elk, Deer and Antelopes, all animals that naturally inhabit this remarkable region are protected in every possible way. All hunters and poachers are rigidly excluded, and in winter, when procuring forage is difficult, the Elk and Antelope are supplied with hay.

Of the bears that inhabit the park in great numbers, the **Grizzly**, or **Silver Tip**, easily deserves first mention; it is the most celebrated of all the bears in the world. Although it is said that more hunters have been maimed and killed by the Grizzly than all other bears of the world combined, he seems to realize that he is being protected and does very little harm in the park. Unless he is cornered, or thinks he is cornered, he will invariably flee from man. The high shoulders, powerful proportions and grizzly-gray hair easily distinguish him from the others. He is a great traveler, swims well, but is unable to climb trees; his food consists of practically anything he can chew, but he is decidedly partial to berries and fruits of all kinds.

A BLACK BEAR

13053

The **Black Bear** is jet black all over except his nose, which is brown; however, a confusing fact about the Black Bear is that frequently its color runs into brown, or cinnamon colors. In one litter there have been found cubs both black and brown. When of a brown color it is called the **Cinnamon Bear**; both are smaller than the Grizzly, are good climbers and, though usually timid, fight in a rough and tumble fashion, with much roaring and growling.

The **Buffalo** or **American Bison**, which but a few years ago grazed in countless thousands on the Western plains, are now counted in tens; only a score or more remain in their natural state—straggling remnants of perhaps the stateliest species of hoofed animals in America; these are roaming over secluded areas in the park unmolested and are seldom seen.

Near Mammoth Hot Springs the National Park Service has a herd of buffaloes—the “show” herd—in a fenced area not far from Mammoth Camp. The “tame” herd, of several hundred, is at the Buffalo Farm, and the

THE WOMAN BEAR

16343

BUFFALO STAMPEDE, LAMAR RIVER VALLEY

16181

“wild” herd is usually near the headwaters of Pelican creek.

The **Prong-horned Antelope**, found only in North America, lives in isolated bands in but few localities in the Rocky Mountains, chiefly in the Yellowstone Park. This keen-eyed animal, fleet of foot and timid, will doubtless soon become extinct in all places but the park; as it does not endure in captivity it must be preserved in its wild state. Like the Elk, Deer and Caribou, the Prong-horned Antelope sheds its horns each year, and they are renewed each year.

**Big Horn Sheep**, or **Mountain Sheep**, are found where the scenery is grandest in high mountain places where none but bold and reckless climbers would dare to go. Its young are reared in the highest and most inaccessible places, and as a result, the larger-birds are their only dangerous enemy. Bands of Mountain Sheep frequent the high bluffs overlooking Gardiner Canyon at the northern part of the park. They are also found in a few widely separated localities in the Rocky Mountains

PRONG-HORNED ANTELOPES NEAR NORTH ENTRANCE

10143

from British Columbia to Mexico. No other wild animal has circling horns; those of the Mountain sheep make nearly a complete circle and are built round and very heavy.

There are thousands of **American Elk**, or **Wapiti**, in Yellowstone Park, several photographs having been taken showing groups of several hundred. The Elk is as tall as a horse, handsomely formed, has a luxurious mane and imposing antlers. Even the young of this species are stately; they "step about with the air of a game cock." It seems remarkable that horns of such great size can be grown to maturity in a few months, to be lost and regrown each year. It is not uncommon for tourists to see Elk and Deer from the roadside while driving over the main highway of the park.

The **Deer** attracts fully as much if not more attention than the Elk on the part of the traveler; two members of the Deer family are prominent in the park, the **Black-tailed**, or **Mule Deer**, and the **White-tailed**

ELK IN HAYDEN VALLEY

16621

**Deer.** The former has larger antlers, consisting of two Y's on each horn. The coat of the Black-tailed Deer is steel gray in winter and gray brown in summer. Except in the park it is being destroyed much faster than it breeds, which means an early extinction of this species. The White-tailed Deer, unlike the Mule Deer, is a skulker; it hides in the brush and carries its head low, so seldom is seen. Its name is derived from its long bushy tail, which is white underneath and pointed.

The most widely known member of the cat family in North America is the **Puma**, or **Mountain Lion**; it makes its den among the rocks or in the dense forests and preys upon every creature that can be killed and eaten, doing much harm to the young Elk, Deer, Mountain Sheep and Antelopes. The Mountain Lion is a good climber; it is tall for its weight, thin-sided and on an average about seven feet long from tip to tip. In color it is a brownish drab. On account of the diligent work on the part of the park authorities, this harmful animal is becoming practically extinct in the reserve.

**Coyotes**, like the Mountain Lion, prey upon the young of many valuable species; they, too, are "shot on sight" by the rangers in the park. They are numerous in the lower altitudes of the park; not infrequently their dog-like yelping is heard in the vicinity of the hotels. Washouts and holes in the sides of ravines furnish dens for the coyote. They multiply with comparative rapidity, having from five to seven puppies each year.

Of the small fur-bearing animals in the park, there are the Otter, Mink, Weasel, Marten, Skunk and Badger.

The **Otter**, being fond of water and living chiefly on fish, makes its home usually under the roots of a large tree overhanging the banks of a stream. It has webbed feet and a thick, flat tail for use in swimming. The fur of the Otter is very fine and of a dark brown color.

The **Mink**, unlike the Otter, is not aquatic, it preys on small mammals and fish when it can procure them, but lives chiefly on birds; it is smaller than the Otter, and its fur, which is yellowish or dark brown, is highly prized.

The **Common Weasel**, or **Ermine**, is a small, long-bodied animal with short legs, the smallest member of the Marten family. It kills grouse, ducks, rabbits and other animals, some ten times its own size, and is considered the most vicious of all animals. In summer its coat is brown, but white in winter, a striking manifestation of Nature's plan of protection.

The **Marten** lives on small rodents, birds and eggs, and spends so much time in the trees that it is often called the **Pine Marten**. Its habitat is on rugged and rocky forest-covered mountains, seldom in open country.

The **Common Skunk** is of conspicuous jet black color, with two wide stripes of white running lengthwise over its back; its fur is becoming valuable on account of the scarcity of Otter, Beaver, Mink and Marten; before being used, however, the white portions are dyed black.

The **Badger** has a broad, flat back, and like the Weasel, has very short legs and is very savage. It lives in burrows and feeds on squirrels and other ground game

A BEAVER HUT IN WINTER

16626

of every description. Along the park highways the **Tree Squirrel** is often seen, while the **Rock Squirrel** (Chipmunk) is likewise abundant. The **Ground Squirrel** lives in the open country in places like Swan Lake Valley, and is seldom seen in rocky places or in the trees.

The **Woodchuck**, or **Ground Hog** is much larger than any squirrel and is of a rich brown color. He is often seen by the roadside sunning himself near his burrow. In autumn he does not store up a winter's supply of provisions like the squirrel, but takes on a quantity of fat under the skin, then goes quietly to sleep in his burrow for four or five months when the winter is severest, hibernating like the bear.

The **Beaver** is celebrated for his engineering skill in building dams, some of great extent, for the purpose of providing in streams a safe refuge from its enemies. He constructs a water entrance to his house and a place below the freezing line for his winter supply of food. The Beaver is easily recognized by its broad, hairless tail, which it uses in swimming. It is not uncommon for

Beavers to fell trees which are as much as a foot in diameter, by gnawing, and it is said that they cut them so they will fall toward their pond. The favorite bark prized by them in the park is the aspen. Beaver dams are seen from the roadway in Willow Park, in Beaver Lake at the foot of Obsidian Cliff, and in several other places in the reserve. The Beavers themselves are seldom seen during the daytime, or in fact at any other time; they work in the evening, beginning about an hour before sundown.

The **Muskrat**, chief member of the family of mice and rats in the park, is found along the banks of streams where burrows can conveniently be made. They are quite as at home in the water as Beavers, and like the Beavers they have powerful tails which serve as the motive power in swimming. Muskrat fur when dyed a rich brown black, plucked and dressed, is known as "French seal."

**Porcupines** are so abundant in the park, and destroy so many trees, it may become necessary to have a lot of them killed. They live chiefly upon bark and are equally at home in the tree-top or on the ground. It is known that the Porcupine has caused the death of more than one Mountain Lion and Lynx by means of its quills; any animal attempting to bite the Porcupine gets its mouth filled with spines, which prevent its eating, causing death by starvation. It has been stated that the quills are thrown by the Porcupines; this, however, is not the fact. When attacked he huddles into a ball completely covered with quills and strikes his adversary with his tail, at the same time lodging in him many painful spines.

**Reptiles** are rare in the park region, and it is a comforting fact that the Rattlesnake is not found above 6,000 feet altitude. The average altitude in the park is 8,000 feet.

## BIRDS OF THE YELLOWSTONE

While the variety of birds in Yellowstone Park is large, only a few of each kind are seen. The most important ones are the Eagle, Osprey, Sea Gull, Pelican, Goose, Swan, Crane, Crow, Raven, Magpie, Lark, Blackbird, Robin, Grouse, Rocky Mountain Jay, Pinyon Jay, Black-headed Jay and a large variety of ducks.

The Osprey, or Fish Hawk, usually builds its nest on inaccessible pinnacles and tree-tops near lakes and streams. The accompanying illustration shows an Osprey's nest in Gardiner Canyon, which since the early days has had the misleading name of Eagle Nest Rock.

EAGLE NEST ROCK

10071

Wild Ducks and Geese are frequently seen from the roadways; and on Yellowstone Lake are many water fowl.

"Large numbers of the Canada geese have reared their young in the park and showed little fear of molestation by visitors. Also ducks of many varieties. Pelicans and gulls occupy the entire surface of one small island in Yellowstone Lake as their nursery. More than seventy species of birds come to the park to rear their young."—GENERAL S. B. M. YOUNG.

## FISH AND FISHING

The United States Bureau of Fisheries has had an important part in making Yellowstone Park one of the foremost resorts for the angler in America. With the exception of Yellowstone Lake and River, practically none of the streams or lakes had native trout, or fish of any kind, in their waters before they were stocked. Since 1890 more than 100,000 fry have been planted in the various streams, and in 1904 a fish hatchery was built at the West Thumb of Yellowstone Lake.

In explanation of the lack of fish in this region, which seems so well suited to their habits, David S. Jordan in 1889 wrote as follows:

"The streams of the park are for the most part among the coldest and clearest of the Rocky Mountains, and apparently in every way suitable for the growth of trout, . . . yet,

TROUT FROM THE MADISON RIVER

AN EIGHTEEN-POUND TROUT  $39\frac{1}{2}$  INCHES LONG CAUGHT IN SHOSHONE LAKE IN 1914 WITH A BAMBOO ROD, A LIGHT TROUT LINE AND A SMALL COLORADO SPINNER.

12563

with exception of the Yellowstone itself, all these streams are destitute of fish life. The plateau is fringed with cataracts which no fish can ascend; each stream has a canyon and waterfall near the point where it exchanges the hard bed of lava for the softer rock below. So the best of trout streams for an area of 1,500 square miles are left without trout, because their natural inhabitants cannot get to them."

Today practically all of the streams in the reserve are well stocked, and afford excellent sport for the angler. Among the varieties of trout are: Rainbow, Brook, Loch Leven, Von Behr, and the native trout; while in the Madison River, near the Western Entrance, are the Grayling, and in the Gardiner River the White fish.

Regulations governing fishing prohibit the use of any other means than the hook and line; no one person is allowed to catch more than twenty fish in one day, and all fish under 8 inches in length must be returned to the water with the least damage possible to the fish.

## FLOWERS OF YELLOWSTONE PARK.

Yellowstone flowers, occurring as they do in almost countless varieties, and in forms frequently quite different from those customary in lower altitudes, afford exceptionally good material for botanical study.

"A plant is not to be studied as an absolutely dead thing, but rather as a sentient being. . . . Since man has learned that the universal brotherhood of life includes himself as the highest link in the chain of organic creation, his interest in all things that live and move and have a being has greatly increased. . . . He sees in each of the millions of living forms with which the earth is teeming, the action of many of the laws which are operating in himself; and has learned that to a great extent his welfare is dependent on these seemingly insignificant relations; that in ways undreamed of a century ago they affect human progress."—CLARENCE MOORES WEED.

One of the most beautiful flowers of the region is the **Fringed Gentian** (*Gentiana elegans*), which grows in profusion in the low, moist meadows and in the vicinity of the geysers. Although usually of a beautiful blue color, specimens have been found in the park which are pure white; these being highly prized by collectors. The Gentian has been chosen for the state flower of Wyoming; its name is from Gentius, King of Illyria, who is credited with having first discovered its medicinal virtue.

The state flower of Montana is the **Bitter-Root** (*Lewisia rediviva*), which gives the name to the Bitter-root Mountains and river. It grows abundantly on the hills in the vicinity of Mammoth Hot Springs and flowers in June and July. The flower grows close to the ground and is of a delicate pink color. Its roots, which are fleshy and farinaceous, have been used extensively for food by the Indians. The name *Lewisia* is in honor of Capt. Lewis of the famous Lewis and Clark expedition.

The **Evening Primrose** (*Oenothera muricata*) is usually found in dry localities, as in Golden Gate Canyon and Snow Pass; although white, or pale yellow, at first,

it later turns a delicate rose color and is very fragrant. It has four delicate, spreading petals, and is about two and one-half inches across; the blossoms appear only in the evening and lie close to the ground.

The true **Forget-Me-Not** (*Mysotis alpestris*) grows only in the higher altitudes in the park, although similar flowers are common throughout the region; along the Yellowstone River and on the sides of Mt. Washburn it is very common, growing in thick clusters close to the ground. Its color is pale blue usually, though in some places it is very dark. The name is from the words "mouse" and "ear," due to the fact that in some species the leaves are short and soft.

The **Harebell** (*Campanula rotundifolia*) grows in the moist, rocky places along the roads, and in the uplands, being quite common in the park. Its bell-shaped flowers of a delicate blue adorn the tips of very slender stems; it blooms from June until September. The name "Campanula" is a diminutive of the Italian "campana," a bell.

The **Shooting Star** (*Dodecatheon meadia*) grows on moist, rocky places along the roads, in the open woods, and prairies of the park. In color it is a purplish-pink, sometimes white, and seems appropriately named, as the flowers nod with petals bent backward as if the flower were really darting through the air.

The **Larkspur** (*Delphinium*, several species), is quite abundant; it grows in open deciduous woods and prairies, is of dark blue color, and is popular in bouquets. This plant is considered poisonous to cattle and horses; its name "Delphinium" is from "Delphin" in allusion to the shape of the flower, which is not unlike the classic dolphin.

The "Mentzelia decapetala," a rare, night-blooming flower of exquisite beauty, grows in the vicinity of Mammoth Hot Springs. The average specimen is four inches across, with ten petals, of a pale yellow color. Another species having five petals is found here, but less

commonly. A peculiarity of these plants is their long barbed leaves, which cause the flower to stick to one's coat without other means. Locally the "Mentzelia" has been erroneously called Night-Blooming Cereus.

The **False Dragon Head** (*Physostegia virginiana*), has large, rose or flesh-colored blossoms, which are showy, in general appearance resembling the False Fox-Glove. Its foliage is of a dark, glossy, green color, and it grows in the moist places near the streams and geysers.

The **Ground Phlox** (*Phlox subulata*), grows in many places along the roads, its habitat being in dry, rocky and sandy places. In color the Phlox is found both pink and white; several species occur in the park. The flowers are small, but grow in clusters over a bed of green close to the ground, producing a very striking effect.

The **Lupine** (*Lupinus perennis*) is very common. It is usually a deep purplish-blue, rarely white. Its habitat is in dry, sandy soil, where it grows abundantly. Lupine is derived from "lupus," a wolf, because these plants were thought to devour the fertility of the soil, while as a matter of fact they seem to prefer the less fertile spots.

The **Columbine** (*Aquilegia canadensis*), is considered one of the most exquisite flowers. It has been selected state flower of Colorado. The flowers are red outside and yellow within, and are large and showy. They are found in many sections of the park, in localities which are forested and rather high in altitude, as in the neighborhood of Mt. Washburn, Undine Falls and Bunsen Peak.

The **Painted Cup** (*Castilleja coccinea*), is usually an intense red, rarely yellow, and looks as though it had been just dipped in paint. It flourishes in shady, sandy places frequently in grassy patches, where its brilliant color is in marked contrast to the green.

A curious flower which may be dried and still preserve its apparent freshness indefinitely is the **Everlast-**

**ing** (*Antennaria dioica rosea*) of a pink, occasionally white color. It occurs in the vicinity of Mammoth Hot Springs and Yellowstone Lake.

**Buttercup** (*Ranunculus montans*), a pretty yellow flower, blooms in June and July and is found near the Grand Canyon and Yellowstone Lake.

**Umbrella Plant** (*Eriogonum subalpinum*) occurs in several species throughout the park and blooms the greater part of the summer.

**Dogtooth Violet** (*Erythronium grandiflorum*) grows in the rich wet soil in the neighborhood of Swan Lake, in the open woods and thickets, and near the streams. The flower has six yellow long, pointed petals and is about two inches across. The stem is not leafed.

Other flowers of less importance in the park are the yellow pond lily, golden rod, clematis, ox-eye daisy, dandelion and late purple aster.

TROUT FISHING IN SNAKE RIVER

## YELLOWSTONE TREES

The forests which cover a large portion of Yellowstone Park are chiefly of one species, the **Black Pine** (*Pinus Murrayana*), sometimes called the Lodge Pole pine on account of its proneness to grow high with very few branches. Over burnt areas it is the first to spring up; and it grows with comparative rapidity.

Next in importance is the **Balsam** (*Abies subalpina*), found to large extent on steep slopes and in moist places, flourishing near the snow fields. It is considered the most beautiful tree in the park forests.

The **White Pine** (*Pinus flexilis*), unlike the balsam, flourishes best in the lower altitudes. It is a hardy but not especially ornamental tree; specimens are seen along the Gardiner River and in the vicinity of Mammoth Hot Springs.

The **Cedar** (*Juniperus scopulorum*), is seen near Mammoth Hot Springs. It is extremely slow growing, and while of little commercial value, it is attractive on account of its ancient, gnarled appearance.

Another species of cedar which is common throughout the park is in appearance more like a shrub than a tree—the *Juniperus sibirica*. It is a rich green in color, grows close to the ground and spreads in all directions from the center.

Other trees of less importance are the Dwarf Maple, Quaking Aspen, Willow and Alder.

Forest growths in the park are for the most part stunted; and are of little value as lumber, although the black pine is used extensively for poles and fuel, the latter use being made of the dead and down timber, which is abundant.

## HISTORICAL.

ALTHOUGH part of it was included in the great Louisiana Purchase of 1803, the Yellowstone Park was not then known to white men. Probably the first one who ever saw any of its hot springs or geysers was John Colter who left the celebrated Lewis and Clark Expedition, which was on its return to St. Louis, in 1806, and started for the headwaters of the Yellowstone River to trap and hunt. This lone adventurer passed northward in 1807 from the mouth of the Big Horn to the Forks of the Shoshoné River where he discovered an immense tar spring; he continued on through a country where much hot spring and geyser phenomena exist and down the Yellowstone River to the ford at Tower Fall, thence out near the northeastern corner of what is now the National Park.

After four years of peril among the Indians and a miraculous escape from the hostile Blackfeet, he returned in 1810 to St. Louis. His wonderful tales were hard to believe and the place he described (which was thought to be the product of his imagination), was termed "Colter's Hell."

The Park had been described in part by some of the early hunters, but their knowledge of the place was limited, due to the fact, no doubt, that the region was so difficult to explore; and it is a fact worthy of note that until 1842 no written description of these geyser regions had ever appeared. But in that year the first description of the geysers was seen in print.

Who the author of the article was was unrevealed. In the year 1900, however, Mr. Olin D. Wheeler, of St. Paul, the author of the wellknown "Wonderland Series of the Northern Pacific Railway" and of "The Trail of Lewis and Clark," discovered the identity of the writer. He was Warren A. Ferris of the American Fur Company, whose early home had been in western New York. In 1834 with two Indians he visited one of the geyser areas,

JAMES BRIDGER

17476

it is not definitely known which, and wrote the description noted which was first printed in the Western Literary Messenger of Buffalo, in July, 1842, from which the Wasp, a Mormon paper of Nauvoo, Illinois, copied it without giving credit to the Messenger. Ferris died near Dallas, Texas, in 1873.

The next written account of the region appeared in 1844, based on information furnished by the noted Rocky Mountain guide, James Bridger:

"He (Bridger) gives a picture most romantic and enticing of the head waters of the Yellowstone," to quote from Gunnison's History of the Mormons, "A lake, sixty miles long, cold and pellucid, lies embosomed among high precipitous mountains. On the west side is a sloping plain, several miles wide, with clumps of trees and groves of pine. The ground resounds with the tread of horses. Geysers spout up seventy feet high, with terrific hissing noise, at regular intervals. Waterfalls are sparkling, leaping and thundering down the precipices, and collect in the pool below. The river issues from this lake, and for fifteen miles roars through the perpendicular

canyon at the outlet. In this section are the 'Great Springs,' so hot that meat is readily cooked in them, and as they descend on successive terraces, afford at length delightful baths. On the other side is an acid spring, which gushes out in a river torrent; and below is a cave, that supplies 'vermillion' for savages in abundance."

Probably no other man in Bridger's time had such a comprehensive knowledge of the Park region.

Captain W. F. Raynolds' Expedition could not penetrate the region when it attempted to explore it in 1860, on account of the snow encountered; the party encircled it however and learned much from the tales of hunters and trappers who had visited it. Captain Raynolds in his report on the "Exploration of the Yellowstone" in 1859-60 states regarding the "Munchausen Tales" about the Park:

"One was to this effect: 'In many parts of the country petrifications and fossils are very numerous, and; as a consequence, it was claimed that in some locality (I was not able to fix it definitely) a large tract of sage is perfectly petrified, with all the leaves and branches in perfect condition, the general appearance of the plain being like that of the rest of the country, but all is stone; while the rabbits, sage hens and other animals usually found in such localities are still there, perfectly petrified, and as natural as when they were living; and, more wonderful still, the petrified bushes bear the most wonderful fruit; diamonds, rubies, sapphires, emeralds, etc., etc., as large as black walnuts, are found in abundance.' "

Captain John Mullan mentions the Park geysers in his report to the government in 1863 and states that he visited them.

The following is taken from the report made to the late Dr. F. V. Hayden, chief of Geological Survey of Territories, by Henry Gannet, E. M., on the geographical field work of the U. S. Geological Survey during the season of 1878:

"The story of the remarkable fruit borne by these stone trees is not far from correct, the main difference between the story and the fact being that the fruit is borne on the outside and inside of the trunk of the trees, instead of on the ends of the branches. The mineral species are not as given in the story, either, but this is a matter of no vital importance. In the process of the silicification of wood the last result of all is the production of quartz crystals. The trunk is converted totally into crystalline quartz, radiating from

within outward, the crystals being all crowded out of shape. The inside and outside of the hollow cylinder of quartz, which represents the former tree, are covered with the characteristic quartz pyramids. Such products of silicification are very abundant in the Park, particularly on Amethyst Ridge, and are, undoubtedly, the stone fruit of the petrified trees and bushes. The crystals are colorless, amethystine or yellow, and according to the color, are known to the mountain men as diamonds, amethyst, topaz, etc. It is unnecessary to say that the part of the story relating to animal life was manufactured from the whole cloth.

"In 1863, Captain W. W. DeLacy, in command of a large party of prospectors, left Montana to prospect on the upper waters of the Snake. Striking that river near the junction of Henry's Fork, they followed up the main river through the canyon, prospected in Jackson's Hole, and, not finding gold in paying quantities, they broke up the party, some returning one way, some another. Captain DeLacy, with a portion of the party, followed up the Snake and Lewis Fork, discovering Lewis and Shoshone (DeLacy's) Lakes, the Shoshone and the Lower Basins. The geographical work done by Captain DeLacy on this trip was embodied in a map of Montana, drawn by himself, and published by authority of the territory in 1864-65, and the material thus made public was afterwards used by the land office in the compilation of maps of that region.

"The results of this trip seem to have attracted little or no attention, for we hear of no one going into the country until 1869, when the prospectors, Cook, Folsom and Peterson, made a prospecting tour through the Park. They followed the Yellowstone up to the mouth of the East Fork, then up the latter stream for a few miles, crossing over to the Yellowstone at the Great Falls; thence they went up this stream to the foot of the lake and around the east side of the latter to the extremity of the west arm; thence crossing over to Shoshone Lake and Lower Geyser Basin on the Madison or Firehole, and finally left the country by following down the Madison River."

Their story, written by David E. Folsom, and published in the Chicago Western Monthly for July, 1870, immediately attracted attention. The following summer a party, composed of prominent citizens of Montana, under the leadership of General Washburn, then Surveyor General of Montana, was made up for the purpose of exploring this region. Among the party were N. P. Langford, first superintendent of the Park, Cornelius Hedges, T. C. Everts, S. T. Hauser and Lieut. G. C. Doane.

Mr. Olin D. Wheeler, of St. Paul, author and historian, in speaking of N. P. Langford's "The discovery of Yellowstone Park, 1870," (published by J. E. Haynes, St. Paul), says:

"In 1870 the Washburn party, escorted by a small contingent of U. S. Cavalry, ventured into the untrailed wilderness and mountain fastnesses now known as Yellowstone National Park. Adventures and hardships of varying sorts befell them; a near-tragedy and possible death afflicted them. They returned from a month's wanderings to electrify their countrymen with their tales of what Nature, unknown to us, had so marvelously accomplished through fire and ice in the long ago.

NATHANIEL P. LANGFORD 17477

"Nathaniel P. Langford, my esteemed friend of years, who so recently followed the winding trail across the Shadowy Divide, was the diarist of the party who, most assiduously, and with a blessed prescience, chronicled in this narrative faithfully and in detail, the heroism and success of these explorers. Descriptively and historically the story stands out in the park literature even as Langford stood out among his fellow men, to the end.

"To the Washburn party we owe the establishment of the park in 1872; and one who desires to have a knowledge of the Park in its entirety misses much if he does not possess this unpretentious but classic narration."

Many of the prominent features of the Park were named by this party—Mount Washburn, the famous promontory, Old Faithful, the Castle and Beehive Geysers, National Park Mountain, and many other points of interest.

While near Yellowstone Lake, Mr. Everts strayed from the party and was lost in an almost impenetrable country. After a diligent but unsuccessful search for him the party was forced to continue their journey.

In the meantime Mr. Everts had been overtaken by a severe storm and while searching on foot for evidence of a trail, lost his eye glasses and was unable to return to his horses. Thirty-seven days later he was found by Jack Barronette in a starved and half demented condition crawling on his hands and knees. Happily he fully recovered from his unfortunate experience.

Expeditions in 1871 under Dr. F. V. Hayden of the United States Geological Survey, and Captains Barlow and Heap of the Engineer Corps of the Army resulted in the discovery of Mammoth Hot Springs and the route from the Lower Basin to the Yellowstone River. A map of the outline of the Yellowstone Lake was made, and collections of specimens were gathered throughout the region. The reports which followed were very complete.

Until 1872, the region was open to settlers without restrictions on hunting, trapping, gathering specimens and the fencing-in of the geysers for private gain. To avoid these dangers the region was set aside as a National Park, March 1, 1872, when President Grant affixed his signature to the Act of Dedication.

## THE ACT OF DEDICATION OF YELLOWSTONE NATIONAL PARK.

Approved March 1, 1872.

BE IT ENACTED BY THE SENATE AND THE HOUSE OF REPRESENTATIVES OF THE UNITED STATES OF AMERICA IN CONGRESS ASSEMBLED:

That the tract of land in the Territories of Montana and Wyoming, lying near the headwaters of the Yellowstone River, and described as follows, to-wit: Commencing at the junction of Gardiner River with the Yellowstone River, and running east to the meridian

passing ten miles to the eastward of the most eastern point of Yellowstone Lake; thence south along the said meridian to the parallel of latitude passing ten miles south of the most southern point of Yellowstone Lake; thence west along said parallel to the meridian passing fifteen miles west of the most western point of Madison Lake; thence north along said meridian to the latitude of the junction of the Yellowstone and Gardiner Rivers; thence east to place of beginning—is hereby reserved and withdrawn from settlement, occupancy or sale under the laws of the United States, and dedicated and set apart as a public park or pleasure ground for the benefit and enjoyment of the people; and all persons who shall locate, settle upon or occupy the same or any part thereof, except as hereinafter provided, shall be considered trespassers and removed therefrom.

SEC. 2. The said public Park shall be under the exclusive control of the Secretary of the Interior, whose duty it shall be, as soon as practicable, to make and publish such rules and regulations as he may deem necessary and proper for the care and management of the same. Such regulations shall provide for the preservation from injury or spoliation of all timber, mineral deposits, natural curiosities or wonders within said park and their retention in their natural condition.

The Secretary may, in his discretion, grant leases for building purposes, for terms not exceeding ten years, of small parcels of ground, at such places in said park as shall require the erection of buildings for the accommodation of visitors; all the proceeds of said leases, and all other revenues that may be derived from any source connected with said park, to be expended under his direction, in the management of the same, and the construction of roads and bridle paths therein. He shall provide against the wanton destruction of the fish and game found within said park, and against their capture or destruction for the purpose of merchandise or profit. He shall also cause all persons trespassing upon the same after the passage of this act to be removed therefrom, and generally shall be authorized to take all such measures as shall be necessary or proper to fully carry out the objects and purpose of this act."

In 1873 Captain W. A. Jones took a large party through the Park. He entered it from the head of the Stinking Water, crossing one of the many passes near Mt. Chittenden. After visiting most of the points of interest in the Park he left via the Upper Yellowstone, on the way verifying the old trapper's legend about the "Two Ocean River," and discovering a practical pass (Togwotee Pass) and route from the south to the Park. This discovery was by far the most valuable result of the expedition.

In 1875 Captain William Ludlow, U. S. A., in charge of a reconnaissance in Central Montana, made a flying trip to the Park. He developed little that was new save more accurate measurements of the Upper and Lower Fall of the Yellowstone.

General O. O. Howard crossed the Park in his famous pursuit of the Nez Perce Indians in 1877; the year that P. W. Norris was made superintendent to succeed N. P. Langford who had held that office five years. Mr. Langford did more for the Park than can be reckoned; he served as superintendent without pay or remuneration of any kind and had upheld the "National Park Idea" from the time the Expedition of 1870 talked of the plan until the Act of Dedication was finally passed in 1872.

CHIEF JOSEPH, NEZ PERCE 13452

The United States Geological Survey resumed work in the Park in 1878 under Dr. F. V. Hayden; and in 1883 a report was published giving detailed descriptions of the points of interest, as well as scientific discussions of the phenomena observed. This report is beautifully illustrated with color-plates, engravings, diagrams and maps.

In August, 1883, President Arthur with the Secretary of War, Lieutenant-General Sheridan of the Army, Senator Vest, and several other distinguished officers and civilians visited the Park in the most elaborate pack-train expedition that has ever been enrolled. The route lay from Green River on the Union Pacific R. R., to Livingston on the Northern Pacific Railway.

PRESIDENT ARTHUR'S PARTY AT UPPER BASIN, AUGUST, 1883

STANDING—Reading from left—Col. Mike Sheridan, U. S. A., Gen. Anson Stager, Capt. Philo Clark, U. S. A., Judge Rawlins, Col. J. F. Gregory, U. S. A.

SITTING—Reading from left—Gov. Schuyler Crosby, Mont., Gen. P. H. Sheridan, U. S. A., President C. A. Arthur, Secretary of War Robt. T. Lincoln, Senator Geo. G. Vest.

F. Jay Haynes, at that time Official Photographer of the Park, procured many interesting photographs of the party and the places they saw on this famous expedition.

**Winter Exploration in 1887.**—In January, 1887, the first successful winter exploration of the Yellowstone region was made. Lieutenant Frederick Schwatka of Arctic fame headed the party consisting of several eastern men, F. Jay Haynes, photographer, and a corps of guides, packers and assistants. Their outfit consisted of astronomical instruments, photographic equipment, sleeping bags and provisions which were drawn on toboggans; the party used Norwegian skis and Canadian web snowshoes, but the snow was so light that they sank readily and the toboggans were exceedingly difficult to draw. It took three days to cover the twenty miles from Mammoth

F. JAY HAYNES IN HAYDEN VALLEY IN 1887

16606

Springs to Norris Basin; and the temperature the first night at Indian Creek was  $37^{\circ}$  below zero.

Unfortunately Lieut. Schwatka fell ill at Norris and was unable to proceed. Mr. Haynes, desirous of obtaining a collection of winter photographs of the Park, employed two of the sturdiest men of the Schwatka party, and with Edward Wilson, a government scout, resumed the journey.

The toboggans were abandoned and this party packed their equipment and provisions on their backs—each man carrying about forty-five pounds.

Norris Basin was a gorgeous sight. Craters heretofore unnoticed by these men familiar with the Park in summer, steamed conspicuously. The foliage was heavily laden with ice near the steam vents and geysers, producing all the fantastic forms possible to imagine; while the entire basin resembled a vast manufacturing centre.

Tall trees buried in the snow appeared like bushes, and the general aspect of the country was completely changed; the average depth of the snow being about eight feet.

THE SKIING PARTY AT OBSIDIAN CLIFF

11018

The steam rising fully two thousand feet from the geysers at Upper Basin could be seen from the Lower Basin.

The beautifully colored walls of the Grand Canyon were masses of pure white. The north half of the Great Fall hung in immense icicles 200 feet in length. An ice bridge fully 100 feet high was formed at the base of the fall, coming up to the spray line (about one-third the height of the fall.) The brink was frozen over and was hidden in an arch of ice a dozen feet thick.

Thousands of elk were seen on the exposed ridges of Mt. Washburn. The trip over Mt. Washburn was one of most unusual hardship and privation; a blinding snow-storm which lasted four days overtook the party of four. During this entire time they wandered day and night without shelter, provisions or fire before reaching Yancey's ranch, an experience that nearly cost them their lives.

The circuit covered was about 200 miles, and the thermometer ranged from 10° to 50° below zero during the twenty-nine days of the trip.

FIRST SIX-HORSE STAGE COACH AND OLD MAMMOTH HOTEL

11250

**Winter Expedition of 1894.**—Early in March, 1894, a party was organized at Fort Yellowstone to visit the winter ranges of the animals, to ascertain the number of buffaloes and photograph them. The party consisted of Captain Scott, Lieut. Forsyth, Scout Burgess, Robert Burns, Photographer Haynes, and three non-commissioned officers. On Norwegian snowshoes, with packs of sleeping bags, provisions and camera, they proceeded directly to Hayden Valley via Norris and the Grand Canyon. They found eighty-one buffaloes in the valley, seventy-three in one herd; and numerous groups of elk. After several days in Hayden Valley the party went to Yellowstone Lake. Captain Anderson, superintendent of the Park, had instructed Scout Burgess not to overlook the country east of the lake, as a small herd of buffaloes usually wintered there. The first day out from the lake they pitched camp about twelve miles up Pelican Creek.

The second day they discovered the “cache” of a poacher, very much to their surprise. It consisted of a canvas tepee, sleeping bag, provisions and toboggan

THE POACHER (RIGHT,) HIS DOG AND CAPTORS

16615

WILD BUFFALO HERD

10133

THE FORERUNNER OF THE AUTOMOBILE STAGE

and six buffalo heads suspended in a tree. A trace of fire in the tepee led them to believe that the poacher was in the vicinity, and to capture him was the next move. As it had been snowing constantly all snowshoe tracks leading from the camp were obliterated. Some five miles from the camp, however, they heard five or six rifle shots in rapid succession. Hastening through the timber to an opening they came directly upon the poacher. He had driven six of the buffaloes into the deep snow and slaughtered them all. Fortunately it was snowing hard, and the approach of the scout was not noticed by the poacher or his dog until the arrest was made. He was taken to the Lake Hotel and from there to the guard house at Fort Yellowstone. In addition to the twelve buffaloes that were killed by this poacher a small herd of seven was seen in the Pelican Creek country, making less than 100 then in the Park. Elk were seen in great numbers in the foothills of Mt. Washburn, on Specimen

Ridge, along the east fork of the Yellowstone, on Slough Creek and the Yellowstone River to Mt. Everts. Small bands of mountain sheep, deers and antelopes were seen on Mt. Everts. The open water of the Yellowstone between the lake and falls was alive with ducks and swans. Red foxes and coyotes were numerous and an occasional black fox and footprints of mountain lions and bears were seen. The party in about thirty days traveled over 300 miles.

The first automobile to enter the park made the trip August 1st, 1915. The party consisted of Colonel L. M. Brett, then Superintendent of the park, Mr. Robert Sterling Yard, of the Department of the Interior, Mr. H. W. Child, President of the Hotel and Transportation Companies, and Major Fries of the Engineer Corps, United States Army.

Shortly afterward the four-horse stage coach, the surrey, the big tally-ho, and the picturesque Western

THE FIRST AUTOMOBILE TO ENTER THE PARK  
AUGUST 1ST, 1915

driver were replaced by the private automobile, the automobile stage and the giant truck. Then necessity brought the Motorcycle Ranger to regulate traffic.

Travel has increased; the high mark of 62,261 tourists was reached in 1919. The average tourist stays several days to see the great features; to study the thermal phenomena, to fish, perhaps to rest. For this is America's greatest playground; dedicated to the people, and most efficiently administered by the National Park Service.

### YELLOWSTONE PARK TRAVEL

Estimates range from one to five thousand each year for the years 1872 to 1894.

### BOOKS ON THE YELLOWSTONE

CHITTENDEN, H. M.—The Yellowstone National Park; Historical and descriptive; 350 pages, illustrated.

HAYNES, JACK E.—Haynes' Guide of the Yellowstone National Park. The complete handbook, descriptive and historical, and complete Road Log. 160 pages, illustrated; maps, diagrams; 1920 ed.

LANGFORD, N. P.—Discovery of Yellowstone Park Diary of the famous expedition of 1870; 124 pages, illustrated, portraits, sketches.

YARD, R. S.—The Book of the National Parks. A comprehensive and interesting book on all of the National Parks. 428 pages, illustrated.

Any of the four books above mentioned may be had at the publisher's prices by addressing

**J. E. HAYNES**

**St. Paul, Minnesota**

**Yellowstone Park, Wyo.**

## THE YELLOWSTONE PARK AND HOW IT WAS NAMED

The Devil was sitting in Hades one day,  
In a very disconsolate sort of a way.  
One could tell from his vigorous switching of tail,  
His scratching his horn with the point of his nail,  
That something had gone with His Majesty wrong,  
The steam was so thick and the sulphur so strong.  
He rose from his throne with a gleam in his eye,  
And beckoning an agate-eyed imp standing by,  
Commanded forthwith to be sent to him there  
Old Charon, employed in collecting the fare  
Of the wicked, who crossed the waters of Styx,  
And found themselves soon in a deuce of a fix.

Old Charon, thus summoned, came soon to his chief.  
As the Devil was angry, the confab was brief.  
Says the Devil to Charon, "Now, what shall I do?  
The world it grows worse and grows wickedder, too;  
What with Portland, Chicago, Francisco, New York,  
I get in my mortals too fast for my fork;  
I haven't the room in these caverns below,  
St. Peter, above, is rejecting them so.  
So hie you, my Charon, to earth, far away.  
Fly over the globe without any delay,  
And find me a spot, quite secluded and drear,  
Where I can drill holes from the center in here.  
I must blast out more space; so survey the spot well,  
For the project on hand is the enlargement of Hell.

"But recollect one thing, Old Charon, when you  
Can locate the district where I can bore through,  
There must be conveniences scattered around  
To carry on business when I'm above ground.  
An 'ink-pot' must always be ready at hand  
To write out the names of the parties I strand.  
There must be a 'punch-bowl,' a 'frying pan,' too,  
A 'cauldron' in which to concoct a 'ragout.'  
An 'old faithful' sentinel showing my power  
Must shoot a salute on the earth every hour,  
And should any mortal by accident view  
The spot you have chosen, why, this you must do:  
Develop a series of pools, green and blue,  
That while these poor earth bugs may beauties admire  
They'll forget that below I'm poking the fire.  
Now fly away, Charon, be quick as you can,  
For my place here's so full that I can't roast a man."

To earth flew fleet Charon, to regions of ice;  
He found these too cold—so away in a trice  
He sought a location in Africa's sands,  
He prospected, and finding too much on his hands  
He cut out Australia, Siberia, too,  
The north part of China—no! they would not do;  
Till just as about to relinquish the chase  
He stumbled upon a most singular place,  
'Twas deep in the midst of a mountainous range,  
Surrounded by valleys secluded and strange,  
In a country the greatest, the grandest, the best  
To be found upon earth—America's West.  
Here the crust seemed quite thin, and the purified air,  
With the chemicals hidden around everywhere,  
Would soon make the lakes that the Devil desired;  
So he flew to Chicago, and there to him wired:  
"I've found you a place never looked at before;  
You may heat up the rocks, turn on water, and bore."  
Then the Devil with mortals kept plying the fire,  
Extracting the water around from the mire,  
And boring great holes with a terrible dust,  
Till soon quite a number appeared near the crust,  
Then he turned on the steam—and lo! upward did fly,  
Through rents in the surface, the rocks to the sky.  
Then with a rumble there came from each spot,  
Huge volumes of water remarkably hot,  
That had been there in caverns since Lucifer fell—  
Thus immensely enlarging the confines of Hell,  
And it happens that now when Old Charon brings in  
A remarkable load of original sin,  
That His Majesty quietly rakes up the coals,  
And up spouts the water, in jets, through the holes,  
One may tell by the number of spurts when they come,  
How many poor mortals the Devil takes home.  
But Yankees can sometimes, without doing evil,  
O'ermatch in sagacity even the Devil.  
For not long ago Uncle Sam came that way  
And said to himself, "Here's the Devil to pay.  
Successful I've been in all previous wars;  
Now Satan shall bow to the Stripes and the Stars.  
This property's mine, and I hold it in fee;  
And all of this earth shall its majesty see.  
The deer and the elk unmolested shall roam,  
The bear and the buffalo each have a home;  
The eagle shall spring from her eyrie and soar  
O'er crags in the canyons where cataracts roar;  
The wild fowls shall circle the pools in their flight,  
The geysers shall flash in the moonbeams at night,  
Now I christen the country—let all nations hark!  
I name it the Yellowstone National Park."

## SUGGESTIONS FOR THE AMATEUR PHOTOGRAPHER

To avoid streaks on the film avoid heat and dampness in the handling of films and the loaded camera; and turn the winding screw slowly. Do not allow the camera to lie in the sun; and do not carry it where the heat from the automobile engine might affect it. Films should not be carried in the hip pocket as one's body temperature is too high for films.

The use of ray filters with the modern orthochromatic film is not advised as it slows up the exposure. This film is very sensitive to both light and heat and should be developed with the utmost care.

After the film has been removed from the camera it should be carefully wrapped, and if valued highly should be developed as soon as possible to insure against deterioration.

A common error is to photograph a geyser at high speed. Those in this book were made at a 25th of a second with the diaphragm at F 16 or F 22 (U. S. 16 or U. S. 32). The best effect is obtained with the sun at the side of the geyser. One should not attempt to make geyser pictures without the direct sun light.

In photographing broad, well-lighted vistas like Yellowstone Lake and Mount Washburn, the 25th of a second is proper if the diaphragm is set at F 32 (U. S. 64). This insures sharpness and full time provided the lens is clean. Every two or three days it should be cleaned both inside and outside of the camera, without unscrewing it and running the risk of throwing out the focus adjustment; breathe on the lens and wipe it gently with a soft handkerchief.

Average scenic films of the amateur are underexposed as the average person overestimates the speed of both his lens and film. When the object being photographed is stationary best results are obtained by using a very small diaphragm, say F 45.2 (U. S. 128). with an exposure of 1 second with good light conditions and with the camera resting absolutely stationary.

In the early morning and late afternoon the light appears stronger than it really is from the fact that the iris of the human eye is then larger than in strong light. This adjustment provided by nature is duplicated in the mechanism of the diaphragm of the camera. Pictures made in poor light with the wide open diaphragm must be carefully focussed to insure sharpness.

The terraces, pools, formations and paint pots may be successfully photographed if a side light is obtained, and the length of exposure and the size of the diaphragm are set the same as in photographing a geyser.

The forests of the Yellowstone are usually very dark in photographs, indicating under-exposure. While distant scenes are usually light from over exposure. The average, successful amateur photograph is taken at a 25th of a second at F 16 (U. S. 16) in the park, provided light conditions are good. This applies whether one has a very fine lens and fast films, or an ordinary lens and ordinary films. The "speed" of lenses with the same diaphragm, whether anastigmat, rapid rectilinear or achromatic is no greater in one than another if they are new and clean. The difference in speed of the films is a matter for the laboratory tester and is hardly appreciable in practice.

In the above suggestions the usual don'ts have been omitted as it is assumed that the reader is familiar with his camera and has obtained good results under ordinary conditions.

The size of the diaphragm is indicated on some cameras by the "U. S." system and others by the foreign system, a comparison of which is given in the following table:

## F. SYSTEM

## UNIVERSAL SYSTEM

F 7.5 is equivalent to U. S.	3.5
F 8 is equivalent to U. S.	4
F 11.3 is equivalent to U. S.	8
F 16 is equivalent to U. S.	16
F 22.6 is equivalent to U. S.	32
F 32 is equivalent to U. S.	64
F 45.2 is equivalent to U. S.	128
F 64 is equivalent to U. S.	256

## PUBLICATIONS BY THE OFFICIAL PHOTOGRAPHER

The "Haynes Catalogue 20" has just been issued. It contains seventy illustrations, descriptions of the sizes, styles and prices of the principal Haynes' pictorial publications of Yellowstone National Park, and may be had for the asking.

Among the items listed are:

Plain, Sepia and Hand Colored photographs.

Hand colored Photogravures.

The Photo Color Set.

Souvenir Folders.

Game of the Yellowstone.

Souvenir Post Cards.

Hand Colored Panoramas.

Hand colored Window Transparencies.

Cameras and Films.

Motion Pictures.

Lantern Slides.

Lantern Slide Cases.

Souvenir Playing Cards.

Langford's "Discovery of Yellowstone Park."

The Haynes Picture Shops in the Yellowstone are situated at Mammoth Hot Springs, Old Faithful, Yellowstone Lake, Grand Canyon and Tower Fall. They are operated by J. E. Haynes Official Photographer, under Government lease from the National Park Service. Winter address: Haynes Studios, St. Paul, Minnesota.

### LANTERN SLIDES

The Haynes Stereopticon slides are of the highest quality both photographically and in coloring. They are guaranteed, and may be returned if unsatisfactory. A Haynes' policy of satisfying which makes imperative the most careful workmanship and true coloring.

"Haynes Catalog 20" gives titles of over four hundred Yellowstone views, all of which are available in lantern slide form.

STANDARD SIZE	EACH
3¼x4 Hand colored.....	\$1.25
Orders for 50 or more.....	1.12
Orders for 100 or more.....	1.00
3¼x4 Plain uncolored.....	.50

### SOUVENIR PLAYING CARDS

#### The Haynes De Luxe Deck

Whether one plays cards or not, this deck is a dignified souvenir and a most acceptable gift. It has gold edges and is put up in a fine telescope case.

The entire collection of fifty-three Yellowstone pictures is shown on the faces. The backs show a beautiful reflection picture in full color. The cards are the very finest, and are intended for hard usage. They have large indices and are easy to play with. All the decks are alike and of standard size.

Published only by Haynes.

Per deck, \$1.00; postage and packing, 10c.

HAYNES PICTURE SHOPS, Yellowstone Park, Wyo.

Per deck, \$1.00; postage and packing, 10c.

HAYNES PICTURE SHOPS, Yellowstone Park, Wyo.

### PHOTO COLOR SET

A Collection of the twelve most important scenes and features of Yellowstone Park printed in Natural Colorings, size 6x9 on fine enameled stock, size 10x13, in suitable Portfolio.

POSTPAID, per set.....\$2.25

---

### SOUVENIR FOLDERS

There are two kinds of folders, each showing 22 important Yellowstone scenes printed on both sides, comprising 44 views, post card size, in full color.

Folder "A", 22 views, 15c each; two for 25c.

Folder "B", 22 views, 15c each; two for 25c.

Postage, per folder, 2c.

---

### GAME OF YELLOWSTONE

An educational and entertaining game for both children and adults, played like Authors. It shows many Yellowstone Scenes, each described briefly and to the point.

Complete, with the Rules of the Game.

POSTPAID.....\$ .60

HAYNES PICTURE SHOPS, Yellowstone Park, Wyo.

## INDEX

- Act of Dedication, 131, 132.  
Albright, Horace M., 14, 142.
